COMPONENTS OF A REAPPRAISAL

To accomplish the task of valuing all parcels within a county as of the January 1 revaluation date, the methodology of mass appraisal rather than the methodology of single-property appraisals must be utilized. Mass appraisal is the systematic appraisal of groups of properties as neighborhoods. This is accomplished by using standardized procedures and statistical testing. In a mass appraisal system, the assessor must make valuation judgments about groups of properties rather than single properties. The assessor must be able to develop, support, and explain standardized adjustments in a valuation model among use classes, construction types, neighborhoods, and other property groups. The guide used for this is the uniform schedule of values. The schedule of values is made up of schedules, standards, rules, tables, and other factors used to apply the correct value to parcels. The schedule of values serves as the county's mass appraisal model and is implemented by means of a computer-assisted mass appraisal system (CAMA). The schedule of values sets forth values for appropriate unit of measurement for use in appraising land and buildings. For example, land may be valued by a set amount per square foot, lot, or acre, depending on the highest and best use, while a dwelling is typically valued using an established amount per square foot. The land unit per appropriate unit of measurement also will vary depending on the neighborhood in which the land is situated. Factors that warrant adjustments are also set forth in the schedule of values for various types of property. The schedule typically authorizes adjustments to land value based on factors such as home-site size, excess acreage, road frontage, topography, zoning, the presence of easements, and other factors. A county's schedule also typically prescribes ranges of characteristics and corresponding percentage adjustments for recognized factors.

Mass appraisal for ad valorem purposes entails many of the same principles as an independent fee, single-property appraisal. Mass appraisal techniques, however, emphasize valuation modules (expressed as equations, tables, and schedules), standards of practice, and statistical quality control. A reassessment program consists of these subsystems:

- 1. A data management system
- 2. A sales analysis system
- 3. A valuation system
- 4. An administrative system

These subsystems are independent of each other. For example, the valuation system uses information maintained in the sales analysis and data management systems and produces output (valuations) required by the administrative system in the production of tax bills.

DATA MANAGEMANT SYSTEM

The data management system has components for collection, entry, editing, organization, conversion, storage, and security of property characteristics and ownership. Quality control of this system is very important because the accuracy of the values determined depends on the reliability of the data from which they are generated. In addition, data collection, conversion,

and maintenance are the most expensive aspect of any reappraisal program. Special care must be given to the thought and planning required of managing logic to minimize cost.

Data maintenance is the protocol for creating new parcels, capturing, and valuing new construction, and making changes to the current property database. The maintenance protocol consists of three components:

- 1. County land records system: the daily creation of new parcels from the recording of "splits" (dividing of an existing parcel), combining existing parcels, and the recording of new subdivision plats feeds the second component.
- 2. Permits and inspections: as the appraisal staff receives notice of new permits and inspections, property record cards are pulled, and new data is collected. Staff receives this information and monitors the construction progress and makes determinations of the percentage of construction completed as of January 1 each calendar year.
- 3. Periodic re-inspection of all properties: routine field visits are supplemented with information obtained from the latest Orthophotography and provided by property owners as part of the annual listing abstracts and requests from taxpayers for review or appeal.

SALES ANALYSIS SYSTEM

The sales system has components for sales data collection, sales screening and processing, ratio studies, and sales reporting. Assessment/sales ratio studies are the primary tool for measuring mass appraisal performance. They are invaluable for monitoring appraisal results, identifying reappraisal priorities, adjusting valuations to the market, and assisting the administrative system in planning and scheduling.

Ratio studies and sales reports draw on values produced by the valuation system and on property characteristics maintained in the data management.

VALUATION SYSTEM

The valuation system (CAMA) consists of mass appraisal applications of the three approaches to value and/or allows for various adjustments that recognize specific aspects of each approach. The three approaches are:

- 1. Cost Approach: requires maintenance and application of computerized cost schedules and equations, depreciation schedules, and indexing factors. This data comes from contractors, building material suppliers, etc.
- 2. Sales Comparison Approach: applications include multiple regression analysis and model building for automated comparable sales analysis.
- 3. Income Approach: will require income multipliers and overall rates. The information to generate this comes from rental, leasing, sales, etc., data provided by owners and tenants.

The optimum results of the valuation system will be to consider all three approaches to value, as appropriate to property type, and determine which method(s) produces the best results for the

final appraisal. Properly executed, any of the three approaches to value will yield creditable results, however the sales comparison and income approaches are highly dependent on available data. Of the three approaches, only the cost approach can be uniformly applied with limited data.

A general county-wide reappraisal depends on data being available from a wide variety of sources in order to properly apply each of the three approaches to value. Even when an abundance of relevant data is available for applying the sales comparison approach and the income approach, that data may also be utilized in refining the cost approach. In the absence of relevant data prior to the final determination of reappraisal values, the cost approach becomes the more reliable approach for all property types. Below is a comparison of the three approaches to value and when best to apply them.

| | | INDUSTRIAL/ |
|---------------------|---------------------|---------------------|
| RESIDENTIAL | COMMERICAL | SPECIAL PURPOSE |
| 1. Sales Comparison | 1. Income | 1. Cost |
| 2. Cost | 2. Cost | 2. Sales Comparison |
| 3. Income | 3. Sales Comparison | 3. Income |

THE ADMINISTRATIVE SYSTEM

The administrative system is comprised of a variety of functions and activities, each of which requires information from sales analysis, valuation, or data management systems and produces products used by the administrative system.

IN-HOUSE REAPPRAISAL

An in-house reappraisal is a major effort requiring careful preparation, the support of county management and the Board of County Commissioners, adequate time, and sufficient funds. In preparing a schedule and reappraisal, the assessor's office should include the relationship between the daily operations of the assessor's office and the reappraisal program. Adequate time to cover probable delays and contingencies to deal with unforeseen problems must be taken into consideration. Even though the reappraisal process should be viewed as separate from daily operations, existing staff, duties, responsibilities, and priorities must be modified and additional staff may be required.

SUMMARY

General reappraisals of real property are required by statutory authority to be performed on an octennial plan (eight-year cycle). Many counties adopt a shorter cycle via a resolution by their respective County Board of Commissioners. The current trend in North Carolina is a four-year cycle for reappraisal with counties to hire and train the staff in order to perform an "In-House" reappraisal as opposed to "contracted" from outside the county lines.

As understood by the assessor's office, an effective reappraisal requires careful planning, a realistic analysis of the present state of the assessment records and values, and the resources needed to conduct the appraisal. As such, reappraisals are a costly, highly visible, and politically

Schedule of Values

Gaston County 2023

sensitive undertaking. However, since the real property staff in the assessor's office understands its own resources and the technical requirements of the task, they are committed to conducting the most fair and equitable reappraisal possible. The success of this endeavor depends on the leadership of the assessor's office, an informed public awareness, and committed management support.

STATUTORY REQUIREMENTS

For an assessor to undertake his responsibilities and duties properly, he must be familiar with the legal framework in which to perform his function. The legal framework sets the guidance and rules to follow for a reappraisal. Some general statutes, but not all, are included in this section. Others will be included throughout this schedule as applicable.

G S 105-286. Time for general reappraisal of Real Property.

- (a) Octennial Cycle. Each county must reappraise all real property in accordance with the provisions of G.S. 105-283 and G.S. 105-317 as of January 1 of the year set out in the following schedule and every eighth year thereafter, unless the county is required to advance the date under subdivision (2) of this section or chooses to advance the date under subdivision (3) of this section.
 - (1) Schedule of Initial Reappraisals. Division Two 1973: ---Gaston
 - (2) Mandatory Advancement. A county whose population is 75,000 or greater according to the most recent annual population estimates certified to the Secretary by the State Budget Officer must conduct a reappraisal of real property when the county's sales assessment ratio determined under G.S. 105-289(h) is less than .85 or greater than 1.15, as indicated on the notice the county receives under G.S. 105-284. A reappraisal required under this subdivision must become effective no later than January 1 of the earlier of the following years:
 - a. The third year following the year the county received the notice.
 - b. The eighth year following the year of the county's last reappraisal.
 - (3) Optional Advancement A county may conduct a reappraisal of real property earlier than required by subdivision (1) or (2) of this subsection if the board of county commissioners adopts a resolution providing for advancement of the reappraisal. The resolution must designate the effective date of the advanced reappraisal and may designate a new reappraisal cycle that is more frequent than the octennial cycle set in subdivision (1) of the subsection. The board of county commissioners must promptly forward a copy of the resolution adopted under this subdivision to the Department of Revenue. A more frequent reappraisal cycle designated in a resolution adopted under this subdivision continues in effect after a mandatory reappraisal required under subdivision (2) of this subsection unless the board of county commissioners adopts another resolution that designates a different date for the county's next reappraisal.

Note: Under the provisions of **GS 105-286 (a)(3),** for 2023 the Gaston County Board of Commissioners adopted a resolution to advance the reappraisal date to January 1, 2023, and continue on a four-year reappraisal cycle from this date.

G S 105-273(13) Definitions

Real property, real estate, or land. – Any of the following:

- a. The land itself.
- b. Buildings, structures, improvements, or permanent fixtures on land.
- c. All rights and privileges belonging or in any way appertaining to the property.

- d. A manufactured home as defined in G.S. 143-143.9(6), unless it is considered tangible personal property for failure to meet all of the following requirements:
 - 1. It is a residential structure.
 - 2. It has the moving hitch, wheels and axles removed.
 - 3. It is placed upon a permanent foundation either on land owned by the owner of the manufactured home or on land in which the owner of the manufactured home has a leasehold interest pursuant to a lease with a primary term of at least 20 years and the lease expressly provides for the disposition of the manufactured home upon termination of the lease.

G S 105-296(b). Powers and duties of assessor.

Within budgeted appropriations, he shall employ listers, appraisers, and clerical assistants necessary to carry out the listing, appraisal, assessing, and billing functions required by law. The assessor may allocate responsibility among such employees by territory, by subject matter, or on any other reasonable basis. Each person employed by the assessor as a real property appraiser or personal property appraiser shall during the first year of employment and at least every other year thereafter attend a course of instruction in his area of work. At the end of the first year of their employment, such persons shall also achieve a passing score on a comprehensive examination in property tax administration conducted by the Department of Revenue.

G S 105-299. Employment of experts.

The board of county commissioners may employ appraisal firms, mapping firms or other persons or firms having expertise in one or more of the duties of the assessor to assist the assessor in the performance of these duties. The county may also assign to county agencies, or contract with State or federal agencies for, any duties involved with the approval or auditing of use-value accounts. The county may make available to these persons any information it has that will facilitate the performance of a contract entered into pursuant to this section. Persons receiving this information are subject to the provisions of G.S. 105-289(e) and G.S. 105-259 regarding the use and disclosure of information provided to them by the county. Any person employed by an appraisal firm whose duties include the appraisal of property for the county must be required to demonstrate that he or she is qualified to carry out these duties by achieving a passing grade on a comprehensive examination in the appraisal of property administered by the Department of Revenue. In the employment of these firms, primary consideration must be given to the firms registered with the Department of Revenue pursuant to the provisions of G.S. 105-289(i). A copy of the specifications to be submitted to potential bidders and a copy of the proposed contract may be sent by the board to the Department of Revenue for review before the invitation or acceptance of any bids. Contracts for the employment of these firms or persons are contracts for personal services and are not subject to the provisions of Article 8, Chapter 143, of the General Statutes.

(1939, c. 310, s. 408; 1971, c. 806, s. 1; 1973, c. 476, s. 193; 1975, c. 508, s. 2; 1983, c. 813, s. 4; 1985, ARTICLE 19)

G S 105-317. Appraisal of real property; adoption of schedules, standards, and rules.

(a) Whenever any real property is appraised it shall be the duty of the persons making appraisals:

- (1) In determining the true value of land, to consider as to each tract, parcel, or lot separately listed at least its advantages and disadvantages as to location; zoning; quality of soil; waterpower; water privileges; dedication as a nature preserve; conservation or preservation agreements; mineral, quarry, or other valuable deposits; fertility; adaptability for agricultural, timber-producing, commercial, industrial, or other uses; past income; probable future income; and any other factors that may affect its value except growing crops of a seasonal or annual nature.
- (2) In determining the true value of a building or other improvement, to consider at least its location; type of construction; age; replacement cost; cost; adaptability for residence, commercial, industrial, or other uses; past income; probable future income; and any other factors that may affect its value.
- (3) To appraise partially completed buildings in accordance with the degree of completion on January 1.
- (b) In preparation for each revaluation of real property required by G.S. 105-286, it shall be the duty of the assessor to see that:
 - (1) Uniform schedules of values, standards, and rules to be used in appraising real property at its true value and at its present-use value are prepared and are sufficiently detailed to enable those making appraisals to adhere to them in appraising real property.
 - (2) Repealed by Session Laws 1981, c. 678, s. 1.
 - (3) A separate property record be prepared for each tract, parcel, lot, or group of contiguous lots, which record shall show the information required for compliance with the provisions of G.S. 105-309 insofar as they deal with real property, as well as that required by this section. (The purpose of this subdivision is to require that individual property records be maintained in sufficient detail to enable property owners to ascertain the method, rules, and standards of value by which property is appraised.)
 - (4) The property characteristics considered in appraising each lot, parcel, tract, building, structure, and improvement, in accordance with the schedules of values, standards, and rules, be accurately recorded on the appropriate property record.
 - (5) Upon the request of the owner, the board of equalization and review, or the board of county commissioners, any particular lot, parcel, tract, building, structure or improvement be actually visited and observed to verify the accuracy of property characteristics on record for that property.

- (6) Each lot, parcel, tract, building, structure, and improvement be separately appraised by a competent appraiser, either one appointed under the provisions of G.S. 105-296 or one employed under the provisions of G.S. 105-299.
- (7) Notice is given in writing to the owner that he is entitled to have an actual visitation and observation of his property to verify the accuracy of property characteristics on record for that property.
- (c) The values, standards, and rules required by subdivision (b) (1) shall be reviewed and approved by the board of county commissioners before January 1 of the year they are applied. The board of county commissioners may approve the schedules of values, standards, and rules to be used in appraising real property at its true value and at its present-use value either separately or simultaneously. Notice of the receipt and adoption by the board of county commissioners of either or both the true value and present-use value schedules, standards, and rules, and notice of a property owner's right to comment on and contest the schedules, standards, and rules shall be given as follows:
 - (1) The assessor shall submit the proposed schedules, standards, and rules to the board of county commissioners not less than 21 days before the meeting at which they will be considered by the board. On the same day that they are submitted to the board for its consideration, the assessor shall file a copy of the proposed schedules, standards, and rules in his office where they shall remain available for public inspection.
 - (2) Upon receipt of the proposed schedules, standards, and rules, the board of commissioners shall publish a statement in a newspaper having general circulation in the county stating:
 - a. That the proposed schedules, standards, and rules to be used in appraising real property in the county have been submitted to the board of county commissioners and are available for public inspection in the assessor's office; and
 - b. The time and place of a public hearing on the proposed schedules, standards, and rules that shall be held by the board of county commissioners at least seven days before adopting the final schedules, standards, and rules.
 - (3) When the board of county commissioners approves the final schedules, standards, and rules, it shall issue an order adopting them. Notice of this order shall be published once a week for four successive weeks in a newspaper having general circulation in the county, with the last publication being not less than seven days before the last day for challenging the validity of the schedules, standards, and rules by appeal to the Property Tax Commission. The notice shall state:

- a. That the schedules, standards, and rules to be used in the next scheduled reappraisal of real property in the county have been adopted and are open to examination in the office of the assessor; and
- b. That a property owner who asserts that the schedules, standards, and rules are invalid may except to the order and appeal therefrom to the Property Tax Commission within 30 days of the date when the notice of the order adopting the schedules, standards, and rules was first published.
- (d) Before the board of county commissioners adopts the schedules of values, standards, and rules, the assessor may collect data needed to apply the schedules, standards, and rules to each parcel in the county.

105-283. Uniform appraisal standards.

All property, real and personal, shall as far as practicable be appraised or valued at its true value in money. When used in this Subchapter, the words "true value" shall be interpreted as meaning market value, that is, the price estimated in terms of money at which the property would change hands between a willing and financially able buyer and a willing seller, neither being under any compulsion to buy or to sell and both having reasonable knowledge of all the uses to which the property is adapted and for which it is capable of being used. For the purposes of this section, the acquisition of an interest in land by an entity having the power of eminent domain with respect to the interest acquired shall not be considered competent evidence of the true value in money of comparable land.

Conflicts of Law and General Irregularities

In the event that any portion of this Schedule of Values, Standards and Rules or the utilization thereof is found to be unlawful or unconstitutional, the balance of the Schedule of Values, Standards and Rules shall remain in full force and effect. Any irregularities discovered in the body of this document shall not invalidate that portion nor the remaining balance of the Schedule of Values, Standards and Rules. Subsequent law changes shall be followed in accordance with and applied to this Schedule of Values, Standards and Rules.

Authors Notes: The Machinery Act of North Carolina has been provided as an integral part of these Uniform Schedules of Value, Standards, and Rules. All applicable not recited in this text are included by reference.

PROPERTY VALUATION

In addition to the specific statutory direction and appellate court rulings, it is necessary to be well-versed with the nature of appraised values of property and with the basic economic principles that serve as the foundation of the valuation process.

APPRAISAL THEORY

An appraisal, in itself, is nothing more than an opinion of value. This does not imply, however, that one opinion is necessarily as good as another; there are valid and accurate appraisals, and there are invalid and inaccurate appraisals. The validity of an appraisal can be measured against the supporting evidence from which it was derived, and its accuracy against that very thing it is supposed to predict - the actual behavior of the market. Each is fully contingent upon the ability of the appraiser to record adequate data and to interpret that data into an indication of value.

Appraising real property, like the solving of any problem, is an exercise in reasoning. It is a discipline and, like any discipline, it is founded on fundamental economic and social principles. From these principles evolve certain premises which, when applied to the valuation of property, serve to explain the reaction of the market. This section concerns itself with those concepts and principles basic to the property valuation process. One cannot overstate the necessity of having a workable understanding of them.

CONCEPT OF PROPERTY

The definition of property should begin the discussion of assessing value. Property is associated with the right of any person to possess, use, enjoy and dispose of a thing. Property, then, is a broad term expressing the relationship between owners and their rights in and to possessions. In appraising real property, the parcel to be appraised includes the rights inherent in ownership of the property and should be included in the opinion of value rendered by the reappraisal.

All property may be divided into two major categories-real property and personal property. Real property is defined as the sum of the tangible and intangible rights in land and improvements. This refers to the interest, benefits, and rights inherent in the ownership of physical real estate. Real estate is the physical land and everything permanently attached to it. Personal property consists of movable items not permanently affixed to, or part of, the real estate and is commonly known as "personal" or "chattels".

Real estate may be divided into two categories-land and improvements. Land is defined as the surface of the earth together with everything under its boundary and everything over it. Improvements (land improvements, such as paving, fencing, structures, and landscaping etc.) consist of immovable items affixed to and becoming part of the real estate. "Permanently affixed" refers to the original intent of the owner and economic life of the improvements.

Defining the term "affixed" has been the subject of much litigation, and the courts are subject to change the meaning. In general terms, personal property annexed to land is called a fixture. Chattels that have been annexed to land are called a fixture.

These chattels that have been annexed to the land, so as to lose their character as chattels, become real estate for ad valorem tax purposes. In determining the nature of the annexation of personal property, there are two basic considerations: first, the adaptability of the personal property to the use part of the realty; and second, the person by whom the annexation is made and his interest in the land and the personal property.

Courts have held that, if the chattel is affixed to the land so that it loses its original physical character and cannot be restored to its original condition as a practical matter; it loses its nature as personal property and becomes real property. Two tests relied upon to determine if personal property becomes real estate are: first the intention of the person who put the item in its place; and second, whether the item may be removed from the real estate without damaging either the item or the real estate. Also, to be considered are the use of the item and the generally accepted conveyance of the item in real estate transactions.

In identifying property, a distinction must be made between that of tangible and intangible property. Tangible property consists of actual physical property. Intangible property is evidence of ownership of property rights. Some examples of intangible property are patent rights, copyrights, notes, mortgages, deeds of trust, and stock certificates.

BUNDLE OF RIGHTS

Real estate and real property are often used interchangeably. Generally speaking, real estate pertains to the real or fixed improvements to the land such as structures and other appurtenances, whereas real property encompasses all the interests, benefits and rights enjoyed by the ownership of the real estate.

Real property ownership involves the Bundle of Rights Theory which asserts that the owner has the right to enter it, use it, sell it, lease it, or give it away, as he so chooses. Law guarantees these rights, but they are subject to certain governmental and private restrictions.

The Governmental restrictions are found in its power to:

- tax property
- take property by condemnation for the benefit of the public, providing that just compensation is made to the owner (Eminent Domain)
- police property by enforcing any regulations deemed necessary to promote the safety, health, morals, and general welfare of the public
- provide for the reversion of ownership to the state in cases where a competent heir to the property cannot be ascertained (Escheat)

Private restrictions imposed upon property are often in the form of agreements incorporated into the deed. The deed also spells out precisely which rights of the total bundle of rights the buyer is acquiring. Since value is related to each of these rights, the appraiser should know precisely which rights are involved in his appraisal.

Appraisals for Ad Valorem tax purposes generally assume the property is owned in the "Fee Simple", meaning that the total bundle of rights is considered to be intact.

THE NATURE AND MEANING OF VALUE

An appraisal is an opinion or estimate of value. The concept of value is basic to the appraisal process and calls for a thorough understanding. The American Institute of Real Estate Appraisers' Appraisal Terminology Handbook, 1981 edition, offers the following definitions of value:

"The measure of value is the amount (for example, of money) which the potential purchaser probably will pay for possession of the thing desired."

"The ratio of exchange of one commodity for another, for example, one bushel of wheat in terms of a given number of bushels of corn; thus the value of one thing may be expressed in terms of another thing. Money is the common denominator by which value is measured."

"It is the power of acquiring commodities in exchange, generally with a comparison of utilities - the utility of the commodity parted with (money) and that of the commodity acquired in the exchange (property)."

"Value depends upon the relation of an object to unsatisfied needs; that is, supply and demand."

"Value is the present worth of future benefits arising out of ownership to typical users and investors."

With these definitions, one can see that value is not an intrinsic characteristic of the commodity itself. On the contrary, value is determined by people, created by desire, modified by varying degrees of desire, and reduced by lack of desire. Throughout the definitions a relationship between the purchase and the commodity (property) is implied; this relationship is "value." A purchaser desires a property because it is a useful commodity in that it has utility. Utility is a prerequisite to value, but utility standing alone does not sufficiently cause value. If a great supply of a useful commodity exists, as for example air, needs would be automatically satisfied, desire would not be aroused, and therefore value would not be created. Therefore, besides having utility, to effectively arouse desire, the commodity must also be scarce.

One additional factor is necessary to complete the value equation . . . the ability to become a buyer. A translation must be made of desire into a unit of exchange; a buyer must have purchasing power. The relationship is now complete . . . the commodity has utility and is relatively scarce, it arouses desire, and the buyer is able to satisfy that desire by trading for it . . . value is created. The question is how much value, and herein lays the job of the appraiser.

Numerous definitions of value have been offered, some simple and some complex. It would seem though that any valid definition of value would necessarily embody the elements of utility, desire, scarcity and purchasing power. Furthermore, the concept of value very rarely stands alone. Instead, it is generally prefixed by a descriptive term that serves to relate it to a specific appraisal purpose or activity such as "loan value". Since appraisals are made for a variety of

reasons, it is important for the appraiser to clarify the specific purpose for the appraisal and the type of value that he seeks to estimate.

For Ad Valorem Tax purposes, the value sought is generally market value. Statute 105-283 from the North Carolina Machinery Act describes market value as follows:

All property, real and personal, shall as far as practicable be appraised or valued at its true value in money. When used in this Subchapter, the words "true value" shall be interpreted as meaning market value, that is, the price estimated in terms of money at which the property would change hands between a willing and financially able buyer and a willing seller, neither being under any compulsion to buy or to sell and both having reasonable knowledge of all the uses to which the property is adapted and for which it is capable of being used. For the purposes of this section, the acquisition of an interest in land by an entity having the power of eminent domain with respect to the interest acquired shall not be considered competent evidence of the true value in money of comparable land.

VALUE IN USE AS OPPOSED TO VALUE IN EXCHANGE

We have stated that there are a number of qualifying distinctions made in reference to the meaning of value. One of the most common and probably the most important relative to the purpose of this manual is the distinction between value in use and value in exchange. We have defined market value as a justifiable price which buyers, in general, will pay in the market. The question arises then as to the value of property which, by nature of its special and highly unique design, is useful to the present owner, but relatively less useful to buyers in the market. One can readily see that such a property's utility value may differ greatly from its potential sales price. It is even possible that no market for such a property exists. Such a property is said to have value in use, which refers to the actual value of a commodity to a specific person, as opposed to value in exchange, which aligns itself with market value, referring to the dollar-value of a commodity to buyers in general. In a sense, value in use embodies the objective premise, which maintains that value is within the object. This concept easily accommodates cost. While with value in exchange the subjective element is accentuated. Value in exchange, being the primary concern for the assessor, reflects the actions and reactions of buyers, sellers and investors and is considered market value.

THE PRINCIPLE OF SUPPLY AND DEMAND

In order for property to have value, there must be desirability, utility, scarcity, and economic purchasing power. Utility is the capacity of goods to create desire and should not be confused with usefulness. While utility is a subjective concept, usefulness is an objective concept inherent in the property.

Scarcity helps to create desire. There are two economic forces which determine scarcity, supply and demand.

Among the forces which constantly operate to influence supply and demand are population growth, new techniques in transportation, purchasing power, price levels, wage rates, taxation, governmental controls, and scarcity. A sudden population growth in an area would create an

increase in demand for housing. If the demand increased at a higher rate than the supply, this could soon be a scarcity of housing. If the demand was backed up by purchasing power, rentals and sale prices would tend to increase and ultimately reach a level which would tend to stimulate more builders to compete for the potential profits and thus serve to increase the supply toward the level of demand. As the supply is increased demand would begin to taper off. This would cause rentals and sale prices to level off. When builders, due to increases in labor and material rates, are no longer able to build cheaply enough to meet the new level of prices and rents, competition would tend to taper off and supply would level off. The cycle is then complete.

Balance occurs when reasonable competition serves to coordinate supply with demand. When competition continues unchecked to produce a volume that exceeds the demand, the net returns to investors are no longer adequate to pay all the costs of ownership, resulting in loss rather than profit and, consequently, a decline in values.

A community may well support two shopping centers, but the addition of a third shopping center may increase the supply to excess. If this occurs, one of two effects are caused; either the net dollar return to all the shopping centers will be reduced below that level necessary to support the investment, or one of the shopping centers will flourish at the others' expense.

Utility and scarcity by themselves do not confer value on an object, unless the desire by the purchaser is present, a desire backed by the economic purchasing power of the buyer(s).

In any discussion of value, a comparison of the terms "cost" and "price" is useful. Cost may be defined as the sacrifice made in the acquisition of property and commonly reflects the perspective of the buyer. Either the purchase of an existing property or the construction of a new property may incur cost. Price may be defined as the amount of money given, expected, or arrived at arranging for the exchange of property. Cost and price may be the same, but not necessarily. An example would be a purchaser pays \$200,000 to buy a property, it may be stated that the property cost \$200,000. However, while price is defined in terms of money, cost is expressed as a sacrifice. A sacrifice may be in terms of money, labor, or time. Also, when property is sold, the price may be either above or below the owner's cost.

THE PRINCIPLE OF HIGHEST AND BEST USE

The way in which property is used, or could be used, plays an essential role in determining its market value. An assessor recognizes this as the highest and best use. The highest and best use for a property is that use which will produce the highest net return to the land for a given period of time within the limits of those uses which are economically feasible, physically possible, probable, and legally permissible.

On a community-wide basis, the major determining factor in highest and best use is the maximum quantity of land that can be devoted to a specific use and still yield a satisfactory return. Once a suitable basic use has been chosen for a specific property, each increment of capital investment to the existing or planned improvement will increase the net return to the

land only up to a certain point; after this point is reached; the net return to the land begins to diminish. This is the point at which the land is at its highest and best use.

For example, in planning a high-rise office building, each additional upper floor represents an extra capital expenditure that must yield a certain return to the investor. This return will be dependent upon the levels of economic rent that the market will bear at the time. An optimum number of floors can be calculated above which the income yield requirements of additional expenditures will no longer be satisfactorily met. This, notwithstanding the possibility of other more particular considerations, should determine the number of stories of the building.

Detailed analysis of this type is rarely thrust upon the property tax appraiser. Generally the tax appraiser will find the most prudent course of action is to consider the present use and follow development rather than anticipate it.

Just as everything changes with time, the highest and best use of property will change. The character of a neighborhood may be altered, thereby creating demands for different uses. The assessor periodically reviews conclusions as to highest and best use and revises them according to the data that are collected. As an example, zoning, one of the restraints on use, may be changed, which changes the allowable use.

BASIC PRINCIPLES OF VALUE

Certain principles are generally accepted as having a direct effect on the modern concept of value evolving from economic doctrine. It should be emphasized that these principles rarely, if ever, can be considered in isolation. It is typical to conceive them in an interrelated setting, for they tend to complement and accompany one another. These principals, after considering the interrelationship among them, result in the highest and best use.

The following principles are essential to appraisal function:

PRINCIPLE OF ANTICIPATION:

Market value is the present worth of all the anticipated future benefits to be derived from the property. Income stream and amenities may be considered benefits. Anticipated future benefits are those benefits anticipated by the market. Past sales of the property and past income are important only when they are an indication of what may be expected in the future. The principle of change works in conjunction with the principle of anticipation.

PRINCIPLE OF BALANCE:

The principle of balance, when applied to a property, states that maximum market value is reached when the four agents of production – labor, coordination or management, capital, and land attain a state of equilibrium.

THE PRINCIPLE OF CHANGE

The principle states that market value is never constant because economic, social, and governmental forces are at work to change property and its environment. Because change is continuous, the estimate of market value is valid only on the effective day for which it is made. This principle works in conjunction with the principle of anticipation.

The impact of change on the value of real property manifests itself in the life cycle of a neighborhood. The cycle is characterized by three stages of evolution: the development and growth evidenced by improving values; the leveling off stage evidenced by static values; and finally, the stage of infiltration of decay evidenced by declining values.

The highest and best use today is not necessarily the highest and best use tomorrow. The highest and best use of the land often lies in a succession of uses. A declining single-family residential neighborhood may be ripe for multi-family, commercial or industrial development. Whether it is or not depends upon the relationship of present or anticipated future demand with existing supply.

In estimating value, the appraiser is obligated to reasonably anticipate the future benefits, as well as the present benefits, derived from ownership and to evaluate the property in light of the quality, quantity, and duration of these benefits based on actual data as opposed to speculative or potential benefits that may or may not occur.

PRINCIPLE OF COMPETITION:

This principle states that when substantial profits are being made, competition is created. This leads to the aphorism that profit tends to breed competition and that excess profit breeds ruinous competition.

PRINCIPLE OF CONFORMITY:

The principle of conformity states that maximum market value is reached when a reasonable degree of economic and social homogeneity is expected in the foreseeable future. As applied to improvements, reasonable homogeneity implies reasonable similarity, not monotonous uniformity. Similarity in age, income, background, etc., is conformity when applied to residents. In understanding the neighborhood concept in mass appraisal, conformity is essential and works with the principles of progression and regression.

PRINCIPLE OF CONSISTENT USE:

This principle states that the property must be valued with a single use for the entire property. Property valued on the basis on one use for land and another for the improvements is improper. The principle is especially applicable to a property in transition from one use to another. While the improvements on a parcel ready for a higher use may theoretically have a long physical life, their economic life may have already terminated.

PRINCIPLE OF CONTRIBUTION:

This principle states that a value of an agent of production (or a property component) depends upon its contribution to the whole. This is another way of saying that cost does not necessarily equal value. Some examples are:

- 1. A garage is erected on an existing home at a cost of \$30,000. Based on comparable sales analysis, it is determined that such a garage adds \$35,000 to the overall market value of the property. In this case \$35,000 is the value contribution of the garage.
- 2. Cost does not always equal value. A stone fireplace cost \$10,000 to construct. Sales analysis in this neighborhood reflects a standard fireplace only adds \$5,000 of value to a home. A stone fireplace may only add \$6,000 of contribution to the value of the home, not the cost of \$10,000.

This principle is the basis for the adjustment process of the comparative sales approach to value and the direct sales comparison method of land valuation, for determining whether physical deterioration and functional obsolescence are curable or incurable, and for justifying remodeling and modernization. Many of the adjustments to value that are detailed herein for various property characteristics are based on their contribution to the whole property, not their actual cost. This principle works in conjunction with the principles of balance, increasing and decreasing returns, and surplus productivity.

PRINCIPLE OF INCREASING AND DECREASING RETURN:

This principle states that, when successive increments of one agent of production are added to fixed amounts of other agents, future net benefits (income or amenities) will increase up to a certain point (point of decreasing returns), after which successive increments will decrease future net benefits.

PRINCIPLES OF PROGRESSION AND REGRESSION:

The principles of progression and regression relate to how surroundings affect the value of an object. Progression indicates that the value of a lessor object is enhanced by association with better objects of the same type. The principle of regression states that, when there are dissimilar properties within the same general classification and in the same area, the better property will be adversely affected.

PRINCIPLE OF SUBSTITUTION

Value is created by the marketplace. It is the function of translating demand into a commodity of exchange. When the benefits and advantages derived from two properties are equal, the lowest priced property receives the greatest demand, and rightfully so. The informed buyer is not justified in paying anything more for a property than it would cost to acquire an equally desirable property. That is to say that the value of a property is established as that amount for which equally desirable comparable properties are being bought and sold in the market. Herein lies an approach to value . . . and the basis of the valuation process.

PRINCIPLE OF SURPLUS PRODUCTIVITY:

This principle states that the net income remaining after the cost of the agents of productionlabor, coordination, and capital has been paid is considered surplus productivity.

MARKET VALUE

The terms "value" and "market value" though similar are not the same. There are many different definitions for market value provided by statutes and constitutions of all fifty states for property taxation and realtors used to market property. The assessor must adhere to the definition of market value as stated in N.C.G.S. 105-283 (see section on statutes) and decisions rendered by the North Carolina Appellate Courts.

The following important points regarding market value should be noted:

- 1. It is the most probable price.
- 2. It is not the highest, lowest, or average price.
- 3. It is expressed in terms of money.
- 4. It implies a reasonable time for exposure to the market.
- 5. It implies that both buyer and seller are well-informed of the uses to which the property may be put. It requires an arm's length transaction in the open market.
- 6. It requires a willing buyer and willing seller, with no advantage being taken by either buyer or seller. Neither buyer nor seller placed in a position of having to purchase or sell to avoid legal action or dispose of property. This is a constraint against consideration of foreclosures and short sales.
- 7. It recognizes the present use as well as the potential use of property.

Note: In analyzing sales of property, close attention is paid to identifying all transactions that are the result of a foreclosure or short sale. Such sales are not retained for further consideration in determining the schedules set out elsewhere in this document, and neither will they be considered in analyzing the reappraisal results via the State-mandated assessment/sales ratio study. For a complete list of conditions, that the NC Department of Revenue distributes to all 100 NC counties to be used in determining qualified or disqualified sales (not consider an arm's length transaction). Please refer to the Deed Edit Sheet on page 350.

TRADITIONAL APPROACHES TO VALUE

In the preceding paragraphs, it has been stated that value is an elusive item that occurs in many different forms, and that the forces and influences which combine to create, sustain, or destroy value are numerous and varied. It is the appraiser's function to define the type of value sought, to compile and to analyze all related data, and, giving due consideration to all the factors which may influence the value, to process and translate that data into a final opinion or *estimate of value*. This he must do for each property he is to appraise.

The processing of this data into a conclusion of value generally takes the form of three recognized approaches to value: Cost Approach, Sales Comparison Approach, and Income

Approach. Underlying each of the approaches is the principle that the justifiable price of a property is no more than the cost of acquiring and/or reproducing an equally desirable substitute property. The use of one or all three approaches in the valuation of a property is determined by the quantity, quality, and accuracy of the data available to the appraiser.

The COST APPROACH involves making an estimate of the depreciated cost of reproducing or replacing the building and site improvements. Reproduction Cost refers to the cost at a given point in time of reproducing a replica property, whereas Replacement Cost refers to the cost of producing improvements of equal utility. Depreciation is deducted from this cost new for loss in value caused by physical deterioration, and functional or economic obsolescence. To this depreciated cost is then added the estimated value of the land, resulting in an indication of value derived by the Cost Approach.

The significance of the Cost Approach lies in its extent of application . . . it is the one approach that can be used on all types of construction. It is a starting point for appraisers, and therefore it is a very effective "yardstick" in any equalization program for Ad Valorem taxes. Its widest application is in the appraisal of properties where the lack of adequate market and income data preclude the reasonable application of the other traditional approaches.

The SALES COMPARISON APPROACH involves the compiling of sales and offerings of properties that are comparable to the property being appraised. These sales and offerings are then adjusted for any dissimilarity and a value range obtained by comparison of said properties. The approach is reliable to the extent that the properties are comparable, and the appraiser's judgment of proper adjustments is sound. The procedure for using this approach is essentially the same for all types of property with the only difference being the elements of comparison.

The significance of this approach lies in its ability to produce estimates of value, which directly reflect the attitude of the market. Its application is contingent upon the availability of comparable sales, and therefore finds its widest range in the appraisal of vacant land and residential properties.

The *INCOME APPROACH* measures the present worth of the future benefits of a property by the capitalization of the net income stream over the remaining economic life of the property. The approach involves making an estimate of the "effective gross income" of a property, derived by deducting the appropriate vacant and collection losses from its estimated economic rent, as evidenced by the yield of comparable properties. From this figure then is deducted applicable operating expense, the cost of taxes and insurance, and reserve allowances for replacements resulting in an estimate of net income, which may then be capitalized into an indication of value.

The approach obviously has its basic application in the appraisals of properties universally bought and sold on their ability to generate and maintain a stream of income for their owners. The effectiveness of the approach lies in the appraiser's ability to relate to the changing economic environment and to analyze income yields in terms of their relative quality and durability.

Property Valuation Techniques

APPLYING THE COST APPROACH

If the highest and best use of a property is its present use, a valid indication of value may be derived by estimating the value of the land and adding the land value to the depreciated value of the structures on the land, the resulting equation being . . .

- Estimated Land Value
- + Estimated Replacement Cost New of Structures
- Estimated Depreciation
- = Indication of Property Value

Since estimating the land value is covered in a separate section, this section will address itself to the two remaining elements, Replacement Cost and Depreciation.

REPLACEMENT COST

Replacement Cost is the current cost of producing an improvement of equal utility to the subject property; it may or may not be the cost of reproducing a replica property. The distinction being drawn is one between *Replacement Cost*, which refers to a substitute property of equal utility, as opposed to *Reproduction Cost*, which refers to a substitute replica property. In a particular situation the two concepts may be interchangeable, but they are not necessarily so. They both, however, have application in the Cost Approach to value, the difference being reconciled in the consideration of depreciation allowances.

In actual practice, outside of a few historic type communities in this country, developers, and builders, for obvious economic reasons, replace buildings, not reproduce them. It logically follows that, if an appraiser's job is to measure the actions of knowledgeable persons in the marketplace, the use of proper replacement costs should provide an accurate point of beginning in the valuation of most improvements.

The replacement cost includes the total cost of construction incurred by the builder whether preliminary to, during the course of, or after completion of the construction of a particular building. Among these are material, labor, all subcontracts, builders' overhead and profit, architectural and engineering fees, consultation fees, survey and permit fees, legal fees, taxes, insurance, and the cost of interim financing.

ESTIMATING REPLACEMENT COST

There are various methods that may be employed to estimate replacement cost new. The methods widely used in the appraisal field are the quantity-survey method, the unit-in-place or component part-in-place method, and the model method.

The Quantity-Survey Method involves a detailed itemized estimate of the quantities of various materials used, labor and equipment requirements, architect and engineering fees, contractor's

overhead and profit, and other related costs. This method is primarily employed by contractors and cost estimators for bidding and budgetary purposes and is much too laborious and costly to be effective in everyday appraisal work, especially in the mass appraisal field. The method, however, does have its place in that it is used to develop certain unit-in-place costs which can be more readily applied to estimating for appraisal purposes.

The *Unit-in-Place Method* is employed by establishing in-place cost estimates (including material, labor, overhead and profit) for various structural components. The prices established for the specified components are related to their most common units of measurement such as cost per yard of excavation, cost per lineal foot of footings, and cost per square foot of floor covering.

The unit prices can then be multiplied by the respective quantities of each as they are found in the composition of the subject building to derive the whole dollar component cost, the sum of which is equal to the estimated cost of the entire building, providing, of course, that due consideration is given to all other indirect costs which may be applicable. This component part-in-place method of using basic units can also be extended to establish prices for larger components in-place, such as complete structural floors (including the finish flooring, sub-floor, joists and framing), which are likely to occur repeatedly in a number of buildings.

The *Model Method* is still a further extension, in that unit-in-place costs are used to develop base unit square foot or cubic foot costs for total specified representative structures in place, which may then serve as "models" to derive the base unit cost of comparable structures to be appraised. The base unit cost of the model most representative of the subject building is applied to the subject building and appropriate tables of additions and deductions are used to adjust the base cost of the subject building to account for any significant variations between it and the model.

Developed and applied properly, these pricing techniques will assist the appraiser in arriving at valid and accurate estimates of replacement cost new as of a given time. This given time for ad valorem tax purposes is always January 1 of the reappraisal year. The cost generally represents the upper limit of value of a structure. The difference between its replacement cost new and its present value is depreciation. The final step in completing the Cost Approach then is to estimate the amount of depreciation and deduct said amount from the replacement cost new.

DEPRECIATION

Simply stated, depreciation can be defined as "a loss in value from all causes." As applied to real estate, it represents the loss in value between market value and the sum of the replacement cost new of the improvements plus the land value as of a given time. The causes for the loss in value may be divided into three broad classifications: Physical Deterioration, Functional Obsolescence, and Economic Obsolescence.

Physical Deterioration pertains to the wearing out of the various building components, referring to both short-life and long-life terms, through the action of the elements, age, and use. The

condition may be considered either "curable" or "incurable," depending upon whether it may or may not be practical and economically feasible to cure the deficiency by repair and replacement. Functional Obsolescence is a condition caused by either inadequacies or over-adequacies in design, style, composition, or arrangement inherent to the structure itself, which tends to lessen its usefulness. Like physical deterioration, the condition may be considered either curable or incurable. Some of the more common examples of functional obsolescence are excessive wall and ceiling heights, excessive structural construction, surplus capacity, ineffective layouts, and inadequate building services.

Economic Obsolescence is a condition caused by factors extraneous to the property itself, such as changes in population characteristics and economic trends, encroachment of inharmonious land uses, excessive taxes, and governmental restrictions. The condition is generally incurable in that the causes lie outside the property owner's realm of control.

ESTIMATING DEPRECIATION

An estimate of depreciation represents an opinion of the appraiser as to the degree that the present and future appeal of a property has been diminished by deterioration and obsolescence. Of the three estimates necessary to the cost approach, it is the one most difficult to make. The accuracy of the estimate will be a product of the appraiser's experience in recognizing the symptoms of deterioration and obsolescence and the ability to exercise sound judgment in equating all observations to the proper monetary allowance to be deducted from the replacement cost new. There are several acceptable methods that may be employed:

Physical deterioration and/or functional obsolescence can be measured by observing and comparing the physical condition and/or functional deficiencies of the subject property as of a given time with either an actual or hypothetical, comparable, new, and properly planned structure.

Curable physical deterioration and functional obsolescence can be measured by estimating the cost of restoring each item of depreciation to a physical condition as good as new or estimating the cost of eliminating the functional deficiency.

Functional and economic obsolescence can be measured by capitalizing the estimated loss in rental due to the structural deficiency or lack of market demand.

Total accrued depreciation may be estimated by first estimating the total useful life of a structure and then translating its present condition, desirability, and usefulness into an effective age (rather than an actual age) which would represent that portion of its total life (percentage) which has been used up.

Total accrued depreciation may also be estimated by deriving the amount of depreciation recognized by purchasers as evidenced in the prices paid for property in the market place; the loss of value being the difference between the cost of replacing the structure now and its actual selling price (total property selling price less the estimated value of the land).

APPLYING THE SALES COMPARISON APPROACH

An indication of the value of a property can be derived through analysis of the selling prices of comparable properties. The use of this technique, often referred to as the "comparison approach" or "comparable sales approach," involves the selection of a sufficient number of valid comparable sales and the adjustment of each sale to the subject property to account for variations in time, location, site, and structural characteristics.

To understand the sales comparison approach an appraiser must understand the principles of supply and demand. The interaction of supply and demand factors impacts property prices. Supply depends on current inventories and, in a larger sense, the availability of human skills, materials, and capital, while demand is influenced by population levels, mortgage rates, income levels, local services, housing trends, and the cost of substitutes. The principal of substitution is one demand factor that implies that the market will recognize differences in utility between the subject and its best alternatives by a difference in price.

The sales comparison approach requires the following steps:

- 1. Definition of the appraisal problem.
- 2. Data collection.
- 3. Analysis of market data to develop units of comparison and select attributes for adjustment (model specifications)
- 4. Development of reasonable adjustments (model calibration).
- 5. Application of the model to adjust the sales prices of comparable properties to the subject property.
- 6. Analysis of the adjusted sales price to indicate the value of the subject property.

The entire valuation process depends on accurately defining the subject property because the nature of the property determines the sources of information, methods of comparable selection, and adjustment techniques.

Defining the subject property includes:

- 1. Identifying the property (parcel number or pin for ad valorem tax purposes)
- 2. The rights to be appraised (generally Fee Simple for ad valorem tax purposes)
- 3. The date of appraisal (January 1 of the appraisal year for NC ad valorem tax purposes)
- 4. The use (highest and best use)
- 5. The type of value to estimate (market value, for NC ad valorem tax purposes)

This approach has a wide application as a method of estimating value; however, there are factors that can or do limit the usefulness of the sales comparison approach. In spite of these limitations, this approach has a broad application in all appraisal work. The value estimates found by the use of this approach are considered particularly significant because they are expressions of value as established by transactions in the market place.

Even though the sales comparison approach is mostly used for estimating market value for residential property, it may also be used for some commercial and industrial properties if sufficient data is available. Additionally, some valuation parameters of the other valuation approaches (cost and income) are influenced by the application of and observations learned from the sales comparison approach.

SELECTING VALID COMPARABLES

Since market value has been defined as the price which an informed and intelligent buyer, fully aware of the existence of competing properties and not being compelled to act, is justified in paying for a particular property, it follows that, if market value is to be derived from analyzing comparable sales, the sales must represent valid "arms-length" transactions. Due consideration must be given to the conditions and circumstances of each sale before selecting the sales for analysis. Some examples of sales that do not normally reflect valid market conditions are as follows:

Sales in connection with foreclosures, short sales, bankruptcies, condemnations and other legal actions.

Sales to or by federal, state, county, and local governmental agencies.

Sales to or by religious, charitable or benevolent tax exempt agencies.

Sales involving family transfers, or "love and affection."

Sales involving intra-corporate affiliations.

Sales involving the retention of life interests.

Sales involving cemetery lots.

Sales involving mineral or timber rights, and access or drainage rights.

Sales involving the transfer of part interests.

In addition to selecting valid market transactions, it is equally important to select properties that are truly comparable to the property under appraisement. For instance, sales involving both real property and personal property or chattels may not be used unless the sale can be adjusted to reflect only the real property transaction, nor can sales of non-operating or deficient industrial plants be validly compared with operating plants. The comparable sales and subject properties must exhibit the same use, and the site and structural characteristics must exhibit an acceptable degree of comparability.

PROCESSING COMPARABLE SALES

All comparable sales must be adjusted to the subject property to account for variations in time and location. The other major elements of comparison will differ depending upon the type of property being appraised. In selecting these elements, the appraiser must give prime consideration to the same factors that influence the prospective buyers of particular types of properties.

The typical homebuyer is interested in the property's capacity to provide the family with a place to live. A primary concern is with the living area, utility area, number of rooms, number of baths, age, structural quality and condition, and the presence of a modern kitchen and recreational conveniences of the house. Equally important is the location and neighborhood, including the proximity to and the quality of schools, public transportation, and recreational and shopping facilities.

In addition to the residential amenities, the buyer of agricultural property is primarily interested in the productive capacity of the land, the accessibility to the marketplace, and the condition and functional utility of the farm buildings and structures on the land.

The typical buyer of commercial property, including warehouses and certain light industrial plants, is primarily concerned with its capability to produce revenue. Of special interest will be the age, design and structural quality and condition of the improvements, the parking facilities, and the location relative to transportation, labor markets and trade centers.

In applying the market data approach to commercial/industrial property, the appraiser will generally find it difficult to locate a sufficient number of comparable sales, especially of properties that are truly comparable in their entirety. It will, therefore, generally be necessary to select smaller units of comparison such as price per square foot, per unit, per room, etc. In doing so, great care must be exercised in selecting a unit of comparison that represents a logical common denominator for the properties being compared. A unit of comparison that is commonly used and proven to be fairly effective is the Gross Rent Multiplier, generally referred to as G.R.M., which is derived by dividing the gross annual income into the sales price. Using such units of comparison enables the appraiser to compare two properties that are similar in use and structural features, but differ significantly in size and other characteristics.

Having selected the major factors of comparison, it remains for the appraiser to adjust each of the factors to the subject property. In comparing the site, adjustments for size, location, accessibility, and site improvements must be made. In comparing the structures, adjustments for size, quality, design, condition, and significant structural and mechanical components also must be made. The adjusted selling prices of the comparable properties will establish a range in value in which the value of the subject property will fall. Further analysis of the factors should enable the appraiser to narrow the range down to the value level that is most applicable to the subject property.

APPLYING THE INCOME APPROACH

INTRODUCTION

The justified price paid for income producing property is no more than the amount of investment required to produce a comparably desirable return; and, since the market can be analyzed in order to determine the net return actually anticipated by investors, it follows that the value of income producing property can be derived from the income which it is capable of producing. What is involved is an estimate of income through the collection and analysis of available economic data, the development of a property capitalization rate, and the processing of the net income into an indication of value by employing one or more of the acceptable capitalization methods and techniques.

THE PRINCIPLES OF CAPITALIZATION

Capitalization is the process for converting the net income produced by property into an indication of value. Through the years of appraisal history, a number of procedures have been recognized and employed by appraisal authorities in determining the value of real estate by the income approach. Although present-day practice recommends only certain methods, we will at least touch on the other approaches to value - even though they may not be accepted in today's appraisal scene because they do not accurately reflect the current market conditions.

EXPLORING THE RENTAL MARKET

The starting point for the appraiser is an investigation of current economic rent in a specific area in order to establish a sound basis for estimating the gross income that should be returned from competitive properties. The appraiser must make a distinction between economic rent, or the rent which property is normally expected to produce on the open market, as opposed to control (actual) rent, or the rent which property is actually realizing at the time of the appraisal due to lease terms established sometime in the past.

The first step then is to obtain specific income and expense data on properties that best typify normal market activity. The data is necessary to develop local guidelines for establishing the economic rent and related expenses for various types of properties.

The next step is to similarly collect income and expense data on individual properties and to evaluate the data against the established guidelines. The collection of income and expense data (I & E) is an essential phase in the valuation of commercial properties. The appraiser is primarily concerned with the potential earning power of the property. The objective is to estimate its expected net income. Income and Expense Statements of past years are valuable only to the extent that they serve this end. The statements must not only be complete and accurate, but must also stand the test of market validity. Consideration of the following factors should assist the appraiser in evaluating the income and expense (I & E) data in order to arrive at an accurate and realistic estimate of net income. This is sometimes referred as net income before recapture.

Gaston County does send surveys soliciting income and expense data from property owners and lessees of commercial (income-producing) property. The return results for these surveys are limited at best. Typically, a more significant amount of additional information is made available as part of the appeal process. This data (income and expense) is generally provided in support of a claim seeking a decrease in appraisal value. The quality/worth of that data is dependent on the documentation provided. Lease information (lease rates, terms, and other stated considerations) is best, with undocumented statements the least useful.

Due to the limited return rate of the survey, the county may utilize other outside sources of information. Even though this may be done on a limited basis it could be useful during the appeal process.

QUESTIONS RELATING TO INCOME DATA

- A. Was the reported income produced entirely by the subject property? Very often the rent will include an amount attributable to one or more additional parcels of real estate. In this case, it would be necessary to obtain the proper allocations of rent.
- B. Was the income attributable to the subject property as it physically existed at the time of the appraisal, or did the appraisal include the value of leasehold improvements and remodeling for which the tenant paid in addition to rent? If so, it may be necessary to adjust the income to reflect economic rent.
- C. Does the reported income represent a full year's return? It is often advisable to obtain both monthly and annual amounts as verification.
- D. Does the income reflect current economic rent? Is either part or all of the income predicated on old leases? If so, what are the provisions for renewal options and rates?
- E. Does the reported income reflect 100% occupancy? What percentage of occupancy does it reflect? Is this percentage typical of this type of property, or is it due to special non-recurring causes?
- F. Does the income include rental for all marketable space? Does it include an allowance for space, if any, which is either owner or manager occupied? Is the allowance realistic?
- G. Is the income attributable directly to the real estate and conventional amenities? Is some of the income derived from furnishings and appliances? If so, it will be necessary to adjust the income or make provisions for reserves to eventually replace them, whichever local custom dictates.
- H. In many properties an actual rental does not exist because the real estate is owner occupied. In this event it is necessary to obtain other information to provide a basis to estimate economic rent. The information required pertains to the business operation using the property. Proper analysis of the annual operating statements of the business, including gross sales or receipts, can provide an accurate estimate of economic rent. Information requirements for a few of the more common property uses are as follows:

Retail Stores The annual net gross sales. (Gross sales less returned

merchandise).

Hotels and Motels The annual operating statement of the business. If retail or office

space is leased in these properties, obtain the actual rent paid.

Gaston County 2023

The annual gross receipts (including admissions and concessions)

and seating capacity.

Automobile Parking The annual gross receipts.

Note: All survey data received from property owners/lessors where their income and expense information is stated is held confidential. Survey data may be compiled into a summary document and incorporated herein for subsequent consideration either prior to a final determination for appraisal purposes or for supporting evidence of value as part of the appeal process.

ANALYSIS OF EXPENSE DATA

The appraiser must consider only those expenses that are applicable to the cost of ownership; that is, those expenses that are normally owner incurred. Any portion of the expenses incurred directly or indirectly by the tenant should not be considered. Each expense item must stand the test of both legitimacy and accuracy. How do they compare with the established guidelines and norms? Are they consistent with the expenses incurred by comparable properties?

Management - refers to the cost of administration. These charges should realistically reflect what a real estate management company would actually charge to manage the property. If no management fee is shown on the statement, an allowance must be made by the appraiser. On the other hand, if excessive management charges are reported, as is often the case, the appraiser must disregard the reported charges and use an amount that he deems appropriate and consistent with comparable type properties. The cost of management bears a relationship with the risk of ownership and will generally range between 4 to 10% of the gross income.

General expenses - may include such items as the cost of services and supplies not charged to a particular category. Unemployment and F.I.C.A. taxes, Workmen's Compensation, and other employee insurance plans are usually legitimate deductions when employees are a part of the building operation.

Reimbursed expenses - refer to the cost associated with the maintenance of public or common areas of the commercial property. This expense is passed on to the tenants and should, therefore, only be considered when the amount of reimbursement is included as income.

Miscellaneous expenses - is the "catch-all" category for incidentals. This item should reflect a very nominal percentage of the income. If expenses reported seem to be excessive, the appraiser must examine the figures carefully in order to determine if they are legitimate expenses and if so, to allocate them to their proper category.

Cleaning expenses - are legitimate charges. They are for such items as general housekeeping and maid service and include the total cost of labor and related supplies. All or a portion of the cleaning services may be provided by outside firms working on a "contract" basis. Cleaning expenses vary considerably and are particularly significant in operations such as offices and hotels. "Rule of thumb" norms for various operations are made available through national management associations. The appraiser should have little difficulty in establishing local guidelines.

Utilities - are generally legitimate expenses and, if reported accurately, need very little reconstruction by the appraiser other than to determine if the charges are consistent with comparable properties. Local utility companies can provide the appraiser with definite guidelines.

Heat and Air Conditioning - costs are often reported separately and in addition to utilities. The expenses would include the cost of fuel other than the above-mentioned utilities and may include, especially in large installations, the cost of related supplies, inspection fees, and maintenance charges. These are generally legitimate costs and the same precautions prescribed for "utilities" are in order.

Elevator expenses - including the cost of repairs and services, are legitimate deductions, and are generally handled through service contracts. These fees can generally be regarded as fairly stable annual recurring expenses.

Decorating and minor alterations - are necessary to maintain the income stream of many commercial properties. In this respect they are legitimate expenses. However, careful scrutiny of these figures is required. Owners tend to include the cost of major alterations and remodeling which are, in fact, capital expenditures and, as such, are not legitimate operating expenses.

Repairs and Maintenance - expenses reported for any given year, are not necessarily a true indication of the average or typical annual expense for these items. For example, a statement could reflect a substantial expenditure for a specific year (possibly because the roof was replaced and/or several items of deferred maintenance were corrected); yet the statement for the following year may indicate that repairs and maintenance charges were practically nil. It is necessary for the appraiser to either obtain complete economic history on each property in order to make a proper judgment as to the average annual expense for these items, or include a proper allowance based on norms for the type and age of the improvements to cover annual expenses. Since it is neither possible nor practical to obtain enough economic history on every property, the latter method is generally used and the amounts reported for repairs and maintenance are then estimated by the appraiser.

Insurance - Caution must be used in accepting insurance expense figures. Cost shown may be for more than one year or may be for blanket policies including more than one building. It is generally more effective for the appraiser to establish his own guidelines for insurance. He must also be careful to include only items applicable to the real estate. Fire extended coverage and owner's liability are the main insurance expense items. Separate coverage on special component parts of the buildings, such as elevators and plate glass, are also legitimate expenses.

Real Estate Taxes - In making appraisals for tax purposes, the appraiser may exclude the actual amount reported for real estate taxes. Since future taxes will be based on his appraised value, the appraiser may express the taxes as a factor of the estimated value. This can be done by including an additional percentage in the capitalization rate to account for real estate taxes. Depreciation - The figure shown for depreciation on an operating statement is a "bookkeeping figure" which the owner uses for Internal Revenue purposes and should not be considered in the income approach. This reflects a tax advantage that is one of the benefits of ownership.

Interest - Although interest is considered a legitimate expense, it is always included in the Capitalization Rate. Most property is appraised as if it were "free and clear;" however, the appraiser does consider the interest of a current mortgage in the Capitalization Rate build-up.

Land Rent - When appraising for real estate tax purposes, only the sum of the leasehold and the leased fee is usually considered. Land rent is not deducted as an expense. Considered separately, rent from a ground lease would be an expense to the leasehold interest and an income to the leased fee. However, if land were rented from another property to supply additional parking for example, that land rent would be an allowable expense.

It is obvious that there are some expense items encountered on operating statements that the appraiser should not consider as allowable. This is because he is interested in legitimate cash expenses only. Income statements are usually designed for income tax purposes where credit can be taken for borrowing costs and theoretical depreciation losses.

It is virtually impossible and certainly not always practical to obtain a complete economic history on every commercial property being appraised. On many properties, however, detailed economic information can be obtained through the use of Income and Expense forms. One must realistically recognize the fact that the data obtainable on some properties is definitely limited.

In most cases, the gross income and a list of the services and amenities furnished can be obtained during the data gathering operation. However, in order to ensure a sound appraisal, it may be necessary to estimate the fixed and operating expenses. This is best accomplished by setting guidelines for expenses, based on a percent of Effective Gross Income or a cost per square foot of leased area. These percentages or costs will vary depending on the services supplied and the type of property.

CAPITALIZATION METHODS

The most prominent methods of capitalization are Direct, Straight Line, Sinking Fund, and Annuity. Each of these is a valid method for capitalizing income into an indication of value. The basis for their validity lies in the action of the market, which indicates that the value of income producing property can be derived by equating the net income with the net return anticipated by informed investors. This can be expressed in terms of a simple equation:

Value = Net Income divided by Capitalization Rate

The *Straight Line* and *Sinking Fund* methods are both actual forms of Straight Capitalization, with one using Straight Line recapture and the other using Sinking Fund recapture. Both methods follow the same basic principles as Direct Capitalization, differing only in that they provide for separate capitalization rates for land and buildings, the building rate differing from the land rate in that it includes an allowance for recapture.

Straight Line Capitalization allows for "recapture" based on remaining economic life of the building - implying that, at the end of that period of time, there would be a zero improvement

value. There are three fallacies in this thinking. First, the potential buyer (investor) has no intention of holding the property that long. The average investment period might average ten years. Second, the investor anticipates that, at the end of that period, he will either get all his money back or will make a profit. And third, is the depreciation allowance possible in connection with federal income taxes.

Depreciation allowances begin to "run out" between seven and ten years, so the advantages of owning the property are reduced considerably. A prudent owner may choose to sell the property at this point and re-invest in another property so that he may begin the depreciation cycle again and continue to take full advantage of the favorable tax laws.

For these reasons, the Straight Line Capitalization Method does not usually follow what the market indicates.

Straight Line Recapture calls for the return of investment capital in equal increments or percentage allowances spread over the estimated remaining economic life of the building.

Sinking Fund Recapture calls for the return of invested capital in one lump sum at the termination of the estimated remaining economic life of the building. This is accomplished by providing for the annual return of a sufficient amount needed to invest and annually re-invest in "safe" interest-bearing accounts, such as government bonds or certificates of deposit, which will ultimately yield the entire capital investment during the course of the building's economic life.

Annuity Capitalization lends itself to the valuation of long-term leases. In this method, the appraiser determines, by the use of annuity tables, the present value of the right to receive a certain specified income over stipulated duration of the lease. In addition to the value of the income stream, the appraiser must also consider the value that the property will have once it reverts back to the owner at the termination of the lease. This reversion is valued by discounting its anticipated value against its present day worth. The total property value then is the sum of the capitalized income stream plus the present worth of the reversion value.

CURRENT TECHNIQUES

There are two methods, however, that do lend themselves to an accurate measure of market value based on potential income. These are Direct Capitalization, utilizing the Direct Comparison Method of Rate Selection, and Mortgage Equity Capitalization.

In *Direct Capitalization*, the appraiser determines a single "overall" capitalization rate. This is done through analysis of actual market sales of similar types of properties. He develops the net income of each property and divides the net income by the sales price to arrive at an overall rate to provide an indication of value. Direct capitalization rates have been relied on in many appellate court rulings for the valuation of income-producing properties for ad valorem tax purposes.

Mortgage Equity Capitalization is a form of direct capitalization with the major difference in the two approaches being the development of the overall capitalization rate.

In this method, equity yields and mortgage terms are considered influencing factors in construction of the interest rate. In addition, a plus or minus adjustment is required to compensate for anticipated depreciation or appreciation. This adjustment can be related to the recapture provisions used in other capitalization methods and techniques.

RESIDUAL TECHNIQUES

It can readily be seen that any one of the factors of the Capitalization Equation (Value = Net Income divided by Capitalization Rate) can be determined if the other two factors are known. Furthermore, since the value of property is the sum of the land value plus the building value, it holds that either of these can be determined if the other is known. The uses of these mathematical formulas in capitalizing income into an indication of value are referred to as the residual techniques, or more specifically, the property residual, the building residual, and the land residual techniques.

The *Property Residual Technique* is an application of Direct Capitalization. In this technique, the total net income is divided by an overall capitalization rate (which provides for the return on the total investment) to arrive at an indicated value for the property. This technique has received more popular support in recent years because it closely reflects the market. With this technique, the capitalization rate may be developed by either "direct comparison" in the market or by the Mortgage Equity Method.

The *Building Residual Technique* requires the value of the land to be a known factor. The amount of net income required to earn an appropriate rate of return on the land investment is deducted from the total net income. The remainder of the net income (residual) is divided by the building capitalization rate (which is composed of a percentage for the return on the investment, plus a percentage for the recapture of the investment) to arrive at an indicated value for the building.

The Land Residual Technique requires the value of the building to be a known factor. The amount of net income required to provide both a proper return on and the recapture of the investment is deducted from the total net income. The remainder of the net income (residual) is then divided by the land capitalization rate (which is composed of a percentage for the return on the investment) to arrive at an indicated value for the land.

MORTGAGE EQUITY METHOD EXAMPLE

For purposes of illustration, assume an investment financed with a 70% loan at 14.0% interest. The term of the mortgage is 20 years, paid off in level monthly payments. The total annual cost for principal and interest on such a loan can be determined by referring to the mortgage equity tables. Select the Constant Annual percent for an interest rate of 14.0% and a term of 20 years. Note that the constant is 14.92% of the amount borrowed, or .92% more than the interest rate alone.

Assume that the equity investor will not be satisfied with less than an 18% yield. The income necessary to satisfy both Lender and Equity can now be shown. The product of the percent

portion and the rate equals the weighted rate. The total of each weighted rate equals the weighted average.

| | PORTION | RATE | | WEIGHTED RATE |
|------------------------------------|----------------|-------|-----|---------------|
| Mortgage loan (principal interest) | 70% | .1492 | = | .1044 |
| Equity (down payment) | 30% | .18 | = _ | .0540 |
| Weighted Average | 100% | | | .1584 |

Note that the "constant annual percent" is used for the rate of the loan.

Since there is a gain in equity's position through the years by the loan being paid off little by little, it is necessary to calculate the credit for "Equity Build-Up." Assume that the investor plans to hold the property for ten years. Since the mortgage is for 20 years, only a portion of the principal will be paid off and this amount must be discounted, as it will not be received for ten years. From the Table of Loan Balance and Debt Reduction, at the end of ten years for a 20-year mortgage at 14%, the figure is .199108. Consulting the sinking fund tables indicates that the discount factor for 18% and 10 years is .0425.

The credit for Equity Build-Up can now be deducted from the basic rate, thus . . .

LAND VALUATION TECHNIQUES

In making appraisals for Ad Valorem Tax purposes, it is generally necessary to estimate separate values for the land and the improvements on the land. In actuality, the two are not separated and the final estimate of the property as a single unit must be given prime consideration. However, in arriving at that final estimate of value, aside from the requirements for property tax appraisals, there are certain other reasons for making a separate estimate of value for the land:

An estimate of land value is required in the application of the Cost Approach. An estimate of land value is required to be deducted from the total property sales price in order to derive indications of depreciation through market-data analysis. (Depreciation being equal to the difference between the replacement cost new of a structure and the actual price paid in the market place for the structure.)

As land is not a depreciable item, a separate estimate of land value is required for bookkeeping and accounting purposes; likewise, the total capitalization rate applicable to land will differ from the rate applicable to the improvements on the land. Since land may or may not be used to its highest potential, the value of land may be completely independent of the existing improvements on the land.

Real Estate is valued in terms of its highest and best use. The highest and best use of the land (or site), if vacant and available for use, may be different from the highest and best use of the improved property. This will be true when the improvement is not an appropriate use and yet makes a contribution to total property value in excess of the value of the site. Highest and Best Use (Highest and Most Profitable Use; Optimum Use) is that reasonable and probable use which will support the highest present value as of the date of the appraisal. Alternatively, it is the most profitable likely use to which a property can be put. It may be measured in terms of the present worth of the highest net return that the property can be expected to produce over a stipulated long run period of time. (American Institute of Real Estate Appraisers' Appraisal Terminology Handbook, 1981 edition.)

As appraisers' opinions are based on data derived from the market, it is necessary to study and adapt, if possible, procedures used by those closest to everyday transactions.

COMPARABLE SALES METHOD

The most frequently used method in estimating the value of land is the comparable sales method in which land values are derived from analyzing the selling prices of similar sites. This method is in essence the application of the market data approach to value and all the considerations pertaining thereto are equally applicable here.

The appraiser must select comparable and valid market transactions, and must weigh and give due consideration to all the factors significant to value, adjusting each to the subject property. The comparable sites must be used in the same way as is the subject property and subjected to the same zoning regulations and restrictions. It is also preferable, whenever possible, to select comparable sales from the same or a similar neighborhood. The major adjustments will be to account for variations in time, location, and physical characteristics to include size, shape, topography, landscaping, access, as well as other factors which may significantly influence the selling price, such as the productivity of farm land.

Although it is always preferable to use sales of unimproved lots for comparison, it is not always possible to do so. Older neighborhoods are not likely to yield a sufficient number of representative sales of unimproved lots to permit a valid analysis. In such cases, in order to arrive at an estimate of land values using the comparable sales approach, it is necessary to consider improved property sales and to estimate the portion of the selling price applicable to the structure. The procedure would be to estimate the replacement cost of the buildings as of the date of sale, estimate the accrued depreciation and deduct that amount from the replacement cost resulting in the estimated selling price of the buildings, which can be deducted from the total selling price of the property to derive the portion of the selling price which can be allocated to the land. The equation is as follows:

Selling Price of Property

- Estimated Depreciated Value of Buildings
- = Indication of Land Value

In some of these older neighborhoods, vacant lots will exist often as a result of fire or normal deterioration. Since the desirability as a new building site is restricted, value is generally determined by adjoining property owners who have a desire for additional land area.

In order to apply the comparable sales method, it is first necessary to establish a common unit of comparison. The units generally used in the valuation of land are price per front foot, price per square foot, price per acre, price per lot or site or home site, price per apartment unit, and price per motel unit. The selection of any one particular unit depends upon the type of property being appraised . . .frontage being commonly used for platted, uniform type residential lots, and square footage and acreage for larger, un-platted tracts, as well as irregularly shaped lots lacking in uniformity. Use of square footage is especially desirable in Central Business Districts where the entire lot maintains the same level of value: depth factor adjustments have a tendency to distort this concept. Commercial arteries are also best valued on a square foot basis.

The utility of a site will vary with the frontage, width, depth, and overall area. Similarly, the unit land values should be adjusted to account for differences in size and shape between the comparable and the subject property. Since such an adjustment is generally necessary for each lot, it is beneficial that the appraiser adopts and/or develops standardized procedures for adjusting the lot size and the unit values to account for the variations. It is not uncommon for all lots within a development to market at the same price. Should data indicate this, it is necessary to make alterations or adjustments to maintain this value level. In some cases, a "site value" concept has advantages. Site value tables provide for uniform pricing of standard sized lots within homogenous neighborhoods or subdivisions. Some of the techniques commonly employed are as follows:

Standard lot sizing techniques provide for the adjustment of the frontage, width, and depth of irregular shaped lots to make the units of measurement more comparable with uniform rectangular lots. Incremental and decremented adjustments can be applied to account for size differences.

Standard Depth Tables provide for the adjustment of front foot unit values to account for variations in depth from a predetermined norm.

Frontage Tables provide for the adjustment of front footage unit values to account for variations in the relative utility value of excessive or insufficient frontage as compared to a predetermined norm.

Acreage or Square Footage Tables provide for the adjustment of unit values to account for variations in the relative utility value of excessive or insufficient land sizes as compared to a predetermined norm.

During the process of adjusting the comparable sales to account for variations between them and the subject property, the appraiser must exercise great care to include all significant factors and to properly consider the impact of each of the factors upon the total value. If done properly, the adjusted selling prices of the comparable properties will establish a range in value in which the value of the subject property will fall. Further analysis of the factors should enable the appraiser to narrow the range down to the value level that is most applicable to the subject property.

THE LAND RESIDUAL TECHNIQUE

In the absence of sufficient market data, income-producing land may be valued by determining the portion of the net income attributable to the land and capitalizing the net income into an indication of value. The procedure is as follows:

- 1. Determine the highest and best use of the land, which may be either its present use or hypothetical use.
- 2. Estimate the net income which the property can be expected to yield.
- 3. Estimate the replacement cost new of the improvements.
- 4. If the case involves the present use, estimate the proper allowance for depreciation, and deduct that amount from the replacement cost new of the improvements to arrive at an estimate of their depreciated value.
- 5. Develop appropriate capitalization rates.
- 6. Calculate the income requirements of the improvements and deduct the amount from the total net income to derive that portion of the income that can be said to be attributable to the land.
- 7. Capitalize the residual income attributable to the land to an indication of value.

RATIO METHOD

A technique useful for establishing broad indications of land values is a "typical" allocation or ratio method. In this technique, the ratio of the land value to the total value of improved properties is observed in situations where there is good market and/or cost evidence to support both the land values and total values. This market abstracted ratio is then applied to similar properties where the total values are known, but the allocation of values between land and improvements are not known. The ratio is usually expressed as a percentage that represents the portion of the total improved value that is land value, or as a formula:

This technique can be used on most types of improved properties, with important exceptions being farms and recreational facilities, provided that the necessary market and/or cost information is available. In actual practice, available market information limits this technique primarily to residential properties and, to a much lesser extent, commercial and industrial properties such as apartments, offices, shopping centers, and warehouses. The ratio technique cannot give exact indications of land values. It is nevertheless useful, especially when used in conjunction with other techniques of estimating land values because it provides an indication of the reasonableness of the final estimate of land value.

The ratio should be extracted from available market information and applied to closely similar properties. It should be noted that any factor that affects the value could also affect the ratio of values. Zoning is particularly important because it may require more or less improvements be made to the land, or may require a larger or smaller minimum size. This tends to have a bearing on the land values, and may influence the ratio of values considerably from community to community.

The following is an example of a residential land valuation situation:

Market information derived from an active new subdivision

| Typical Lot Sale Price (most lots equiv | valent) | | | \$15,000 |
|---|----------|--------|----------|------------------|
| Improved Lot Sales (range) | | | \$65 | ,000 to \$75,000 |
| Indicated Ratio | \$15,000 | 15,000 | - X 100% | 20% to 23% |
| Illulcated Katio | 75,000 | 65,000 | - A 100% | 2070 10 2370 |

Similar subdivision, but 100% developed

| Typical Lot Sale Price (most lots equivalent) | Unavailable |
|---|-----------------------|
| Improved Lot Sales (range) | \$85,000 to \$105,000 |
| Broadest Indicated Range of Lot Values (20% x \$85,000 to 23% x \$105,000) | \$17,000 to \$24,150 |
| Narrowest Indicated Range of Lot Values (23% x \$85,000 to 20% x \$105,000) | \$19,550 to \$21,000 |

If both lots and improvements vary considerably, the broadest range is most appropriate. If most lots vary little and are judged equivalent, but the improvements vary somewhat, the narrowest range is appropriate. Most subdivisions exhibit a combination of the two ranges, showing a narrow typical range, but a wider actual range of land values.

MASS APPRAISING

In preceding sections, we have outlined the fundamental concepts, principles, and valuation techniques underlying the Appraisal Process. We will now approach the problem at hand . . . the reappraisal of certain specified real property within a total taxing jurisdiction, be it an entire county or any subdivision thereof . . . and to structure a systematic mass appraisal program to affect the appraisal of said properties in such a way as to yield valid, accurate, and equitable property valuations at a reasonable cost dictated by budgetary limitations, and within a time span totally compatible with assessing administration needs.

The key elements of the program are validity, accuracy, equity, economy, and efficiency. To be effective, the program must. . .

- incorporate the application of proven and professionally acceptable techniques and procedures;

- provide for the compilation of complete and accurate data and the processing of that data into an indication of value approximating the prices actually being paid in the market place as of the effective assessment date;
- provide the necessary standardization measures and quality controls essential to promoting and maintaining uniformity throughout the jurisdiction;
- provide the appropriate production controls necessary to execute each phase of the operation in accordance with a carefully planned budget and work schedule; and
- provide techniques especially designed to streamline each phase of the operation, eliminating superfluous functions, and reducing the complexities inherent in the Appraisal Process to more simplified but equally effective procedures.

In summary, the objective of an individual appraisal is to arrive at an opinion of value, the key elements being the validity of the approach and the accuracy of the estimate. The objective of a mass appraisal for tax purposes is essentially the same. However, in addition to being valid and accurate, the value of each property must be equitable to that of each other property and, what is more, these valid, accurate, and equitable valuations must be generated as economically and efficiently as possible.

OVERVIEW

The prime objective of mass appraisals for tax purposes is to equalize property values. Not only must the value of one residential property be equalized with another, but it must also be equalized with each agricultural, commercial, and industrial property within the political unit. The common denominator or the basis for equalization is market value as set forth by N.C.G.S. 105-283... that price which an informed and intelligent person, fully aware of the existence of competing properties and not being compelled to act, is justified in paying for a particular property.

The job of the appraiser is to arrive at a reasonable estimate of that justified price. To accomplish this, the coordination of approaches to the valuation of the various classes of property must be made so that they are related one to another in such a way as to reflect the motives of the prospective purchasers of each type of property.

A prospective purchaser of a residential property is primarily interested in its capacity to render service to the family as a place to live. Its location, size, quality, design, age, condition, desirability, and usefulness are the primary factors to be considered in making a selection. By relying heavily upon powers of observation and inherent intelligence, knowing what could be afforded and simply comparing what is available, one property will eventually stand out to be more appealing than another. So, it is likewise the job of the appraisers to evaluate the relative degree of appeal of one property to another for tax purposes.

The prospective purchaser of agricultural property will be motivated somewhat differently. The primary interest will be in the productive capabilities of the land. It is reasonable to assume that the purchaser will be familiar, at least in a general way, with the productive capacity of the

farm. It might be expected that the prudent investor will have compared one farm's capabilities against another. Accordingly, the appraiser for local tax equalization purposes must rely heavily upon prices being paid for comparable farmland in the community.

The prospective purchaser of commercial property is primarily interested in the potential net return and tax shelter the property will provide. That price which is justified to pay for the property is a measure of the prospects for a net return from the investment. Real estate, as an investment then, must not only compete with other real estate, but also with stocks, bonds, annuities, and other similar investment areas. The commercial appraiser must explore the rental market and compare the income-producing capabilities of one property to another.

The prospective purchaser of industrial property is primarily interested in the overall utility value of the property. Of course, in evaluating the overall utility, individual consideration must be given to the land and each improvement thereon. Industrial buildings are generally of special purpose design and, as such, cannot readily be divorced from the operation for which they were built. As long as the operation remains effective, the building will hold its values; if the operation becomes obsolete, the building likewise becomes obsolete. The upper limit of its value is its replacement cost new, and its present day value is some measure of its present day usefulness in relation to the purpose for which it was originally designed.

Any effective approach to valuations for tax purposes must be patterned in such a way as to reflect the "modus operandi" of buyers in the market place. As indicated above, the motives influencing prospective buyers tend to differ depending upon the type of property involved. It follows that the appraiser's approach to value must differ accordingly.

The residential appraiser must rely heavily upon the sales comparison approach to value . . . Analyzing the selling prices of comparable properties and considering the very same factors of location, size, quality, design, age, condition, desirability, and usefulness, which were considered by the buyer.

The commercial appraiser will find that, since commercial property is not bought and sold as frequently as is residential property, the sales market cannot be readily established. By relying heavily on the income approach to value, the net economic rent that the property is capable of yielding can be determined, and the amount of investment required to affect that net return at a rate commensurate with that normally expected by investors could also be determined. This can only be achieved through a comprehensive study of the income-producing capabilities of comparable properties and an analysis of present-day investment practices.

The industrial appraiser will not be able to rely on the market data approach because of the absence of comparable sales, each sale generally reflecting different circumstances and conditions. Also, it is not possible to rely upon the income approach. ... again because of the absence of comparable investments, and because of the inability to accurately determine the contribution of each unit of production to the overall income produced. Therefore, by relying heavily on the cost approach to value, a determination must be made of the upper limit or replacement cost new of each improvement and the subsequent loss of value resulting overall from physical, functional, and economic factors.

The fact that there are different approaches to value, some of which are more applicable to one class of property than to another does not, by any means, preclude equalization between classes. Remember that the objective in each approach is to arrive at a price which an informed and intelligent person, fully aware of the existence of competing properties and not being compelled to act, is justified in paying for any one particular property. Underlying and fundamental to each of the approaches is the comparison process. Regardless of whether the principal criteria are actual selling prices, income-producing capabilities, or functional usefulness, like properties must be treated alike. The primary objective is equalization (the equitable distribution of the tax burden). The various approaches to value, although valid in themselves, must nevertheless be coordinated one to the other in such a way as to produce values that are not only valid and accurate, but are also equitable. The same "yardstick" of values must be applied to all properties and must be applied by systematic and uniform procedures.

It is obvious that sales on all properties are not required to effectively apply the market data approach. The same is true regarding any other approach. What is needed is a comprehensive record of all the significant physical and economic characteristics of each property in order to compare the properties of "unknown" values with the properties of "known" values. All significant differences between properties must in some measure, either positively or negatively, be reflected in the final estimate of value.

Each property must be given individual treatment, but the treatment must be uniform and standardized, and essentially no different than that given to any other property. All the factors affecting value must be analyzed and evaluated for each and every property within the entire political unit. It is only by doing this that equalization between properties and between classes of properties can be ultimately affected.

All this, at best, is an oversimplification of the equalization process underlying the entire Mass Appraisal Program. The program itself consists of various operational phases, and its success depends primarily upon the systematic coordination of collecting and recording data, analyzing the data, and processing the data to an indication of value.

SALES RATIO

General Discussion

One of the most used methods of analyzing sales is the sales ratio. Property tax is an ad valorem tax (according to value) and, because value is defined as "market" value and because market value is evaluated by measuring "sales" of properties in the marketplace, then the quality of a group of assessments may be evaluated by measuring their ratio to the real estate sales from the same geographical area as of the assessments. Assessment/sales ratio study is the comparing of appraised value to sale prices.

The word "ratio" is a statistical term that, when numerically expressed, simplifies the comparison of magnitude of numbers. They are various types of ratios, distinguished by their base of comparison, that is the denominator of the fraction, and they may take the form of fractions, proportions, percentages or rates. Some of the leading types of ratios are the result of

comparing a part to its whole, comparing a part to a part within a whole, or comparing one whole to another whole.

The assessor's office main purpose is to value all properties uniformly and equitably. Therefore, it is incumbent on the appraiser to place property values that represent the current probable selling price or some constant fraction thereof.

One of the most meaningful and useful tools in measuring the quality of the real property appraisal is the ratio study. The measurements (commonly referred to as ratio studies and median assessment levels) can be either in the aggregate or sectional and are found by comparing the value placed on properties which have sold with the amount for which the property actually sold.

Caution should be used when reviewing sales ratio results for the properties that comprise a sales file, which does not always constitute a representative sample of the property type (class) population within the County. The calculated results could be biased, even if carefully weighted, for some important classes of properties are seldom, if ever, sold.

DATA INVENTORY

Basic to the appraisal process is the collecting and recording of pertinent data. The data will consist of general supporting data, referring to the data required to develop the elements essential to the valuation process; neighborhood data, referring to information regarding predelineated neighborhood units; and specific property data, referring to the data compiled for each parcel of property to be processed into an indication of value by the cost, market and/or income approach.

The data must be comprehensive enough to allow for the adequate consideration of all factors that significantly affect property values. In keeping with the economics of a mass appraisal program, it is costly and impractical to collect, maintain, and process data of no or marginal contribution to the desired objectives. The axiom "too much data is better than insufficient data" does not apply. What does apply is the proper amount of data, no more or no less, which is necessary to provide the database necessary to generate the desired output.

Cost data must be sufficient enough to develop or select and validate the pricing schedules and cost tables required to compute the replacement cost new of improvements needed to apply the cost approach to value.

All data pertaining to the cost of total buildings in place should include the parcel identification number, property address, and date of completion, construction cost, name of builder, source of information, structural characteristics, and other information pertinent to analysis.

Cost information may be recorded on the same form (unassigned property record card) used to record specific property data.

The principal sources for obtaining cost data are builders, suppliers, and developers, and it is generally advisable to collect cost data in conjunction with new construction pick-ups.

Sales data must be sufficient enough to provide a representative sampling of comparable sales needed to apply the market data approach, to derive unit land values and depreciation indicators needed to apply the cost approach, and to derive gross rent multipliers and elements of the capitalization rate needed to apply the income approach.

All sales data should include the parcel identification number, property qualification code, month, and year of sale, selling price, source of information, i.e., buyer, seller, agent, or fee, and a reliable judgment as to whether or not the sale is representative of a true arm's length transaction.

Sales data should be recorded on the same form (assigned property record card) used to record specific property data, and verified during the property-listing phase.

The principal source for obtaining sales data is the County Register of Deeds Office, MLS, Sales Letters, Fee Appraisers, and the real estate transfer returns. Other sources may include developers, realtors, lending institutions, and individual owners during the listing phase of the operation.

Income and expense data must be sufficient enough to derive capitalization rates and accurate estimates of net income needed to apply the income approach. Income and expense data should include both general data regarding existing financial attitudes and practices, and specific data regarding the actual incomes and expenses realized by specific properties.

The general data should include such information as equity return expectations, gross rentals, vacancy and operating cost expectations and trends, prevailing property management costs, and prevailing mortgage costs.

Specific data should include the parcel identification number, property address (or building ID), source of information, the amount of equity, the mortgage and lease terms, and an itemized account of the annual gross income, vacancy loss, and operating expenses for the most recent two-year period.

The general data should be documented in conjunction with the development of capitalization procedural guidelines. The specific data, since it is often considered confidential and not subject to public access, should be recorded on special forms, designed in such a way as to accommodate the property owner or agent thereof in submitting the required information. The forms should also have space reserved for the appraiser's analysis and calculations.

The principal sources for obtaining the general financial data are investors, lending institutions, fee appraisers and property managers. The primary sources for obtaining specific data are the individual property owners and/or tenants during the listing phase of the operation.

Neighborhood data. At the earliest feasible time during the data inventory phase of the operation, and after a thorough consideration of the living environment and economic characteristics of the overall county, or any political sub-division thereof, the appraisal staff should delineate the larger jurisdictions into smaller "neighborhood units," each exhibiting a high degree of homogeneity in residential amenities, land use, economic trends, and housing

characteristics such as structural quality, age, and condition. The neighborhood delineation should be outlined on an index (or comparable) map and each assigned an arbitrary Neighborhood Identification Code which, when combined with the parcel identification numbering system, will serve to uniquely identify it from other neighborhoods.

Neighborhood data must be comprehensive enough to permit the adequate consideration of value-influencing factors to determine the variations in selling prices and income yields attributable to benefits arising from the location of one specific property as compared to another. The data should include the taxing district, the school district, the neighborhood identification code, special reasons for delineation (other than obvious physical and economic boundaries), and various neighborhood characteristics such as the type (urban, suburban, etc.), the predominant class (residential, commercial, etc.), the trend (whether it is declining, improving, or relatively stable), its accessibility to the central business district, shopping centers, interstate highways and primary transportation terminals, its housing characteristics, the estimated range of selling prices for residentially-improved properties, and a rating of its relative durability.

All neighborhood data should be recorded on a specially designed form during the delineation phase. The existing property record card can serve in this capacity as it contains the current data on file.

Specific property data must be comprehensive enough to provide the data base needed to process each parcel of property to an indication of value, to generate the tax roll requirements, to generate other specified output, and to provide the assessing officials with a permanent record to facilitate maintenance functions and to administer taxpayer assistance and grievance proceedings.

The data should include the parcel identification number, ownership and mailing address, legal description, property address, property classification code, local zoning code, neighborhood identification code, site characteristics, and structural characteristics.

All the data should be recorded on a single, specially-designed property record card customized to meet individual assessing needs. Each card should be designed and formatted in such a way as to accommodate the listing of information and to facilitate data processing. In addition to the property data items noted above, space must be provided for a building sketch, land and building computations, summarization, and memoranda. In keeping with the economy and efficiency of a mass appraisal program, the card should be formatted to minimize writing by including a sufficient amount of site and structural descriptive data that can be checked and/or circled. The descriptive data should be comprehensive enough to be suitable for listing any type of land and improvement data regardless of class, with the possible exception of large industrial, institutional, and utility complexes that require lengthy descriptions. In these cases, it will generally be necessary to use a specially-designed supplemental property record document, keyed and indexed to the corresponding property record card. The property record card should be made a permanent part of the assessing system, and used not only in conjunction with the revaluation, but also to update the property records for subsequent assessments.

The specific property data should be compiled from existing assessing records and field inspections. The parcel identification number, ownership, mailing address, and legal description may be obtained from existing tax rolls. Property classification codes may also be obtained from existing tax rolls (whenever available) and verified in the field. Local zoning codes may be obtained from existing zoning maps. Neighborhood identification codes may be obtained from the neighborhood delineation maps. Lot sizes and acreage may be obtained from existing tax maps. The property address and the site and structural characteristics may be obtained by making a physical inspection of each property.

In transferring lot sizes from the tax maps to the property record cards, the personnel performing the tasks must be specially trained in the use of standardized lot sizing techniques and depth tables may be used, which are necessary to adjust irregular shaped lots and abnormal depths to account for variations from predetermined norms. In regard to acreage, the total acreage may be transferred, but the acreage breakdowns required to affect the valuation of agricultural, residential, forestry, commercial, and industrial properties must be obtained in the field from the property owner and verified by personal observation and aerial photographs, if available.

Field inspections or the listing of new construction must be conducted by the appraiser or qualified data collectors under the close supervision of the appraisal staff. During this phase of the operation, the data collectors must visit each property. In the course of the inspection, the following procedures must be adhered to.

Identification of the property.

View the property classification and zoning codes.

Recording the property address.

If possible, interviewing the occupant of the building and recording all pertinent data.

Interior inspection of the building when requested by the property owner or when permissible.

Measuring and inspecting the exterior of the building, as well as all other improvements on the property, and recording the story height and the dimensions and/or size of each.

Recording a sketch of the principal building(s), consisting of a plan view showing the main portion of the structure along with any significant attached exterior features, such as porches, etc. All components must be identified and the exterior dimensions shown for each.

Selection of and recording the proper quality grade of the improvement.

Selection of and recording the proper adjustments for all field priced items.

Reviewing the property record card for completeness and accuracy.

After the field inspection is completed, the property record cards must be submitted to clerical personnel to complete data entry of the property record cards.

Complete and accurate data are essential to the program. Definite standardized data collection and recording procedures must be followed if these objectives are to be met.

PROCESSING THE DATA

This phase of the operation involves the analysis of data compiled during the data inventory phase and the processing of that data to an indication of value through the use of the cost, market, and income approaches to value.

During the analytical phase, it will be necessary to analyze cost, market, and income data in order to provide a basis for validating the appropriate cost schedules and tables required to compute the replacement cost new of all buildings and structures; for establishing comparative unit land values for each class of property; for establishing the appropriate depreciation tables and guidelines for each class of property; and for developing gross rent multipliers, economic rent and operating expense norms, capitalization rate tables and other related standards and norms required to effect the mass appraisal of all the property within an entire political unit on an equitable basis.

After establishing the appropriate standards and norms, it remains to analyze the specific data compiled for each property by giving due consideration to the factors influencing the value of that particular property as compared to another, and then to process the data into an indication of value by employing the techniques described in the section of the manual dealing with the application of the traditional approaches to value.

Any one, or all three of the approaches, if applied properly, should lead to an indication of market value; of primary concern is applying the approaches on an equitable basis. This will require the coordinated effort of a number of individual appraisers, each appraiser acting as a member of a team, with the team effort directed toward a valid, accurate and equitable appraisal of each property within the political unit. Each property must be physically reviewed, during which time the following procedures must be adhered to.

- verification of the characteristics recorded on the property record card.
- certification that the proper schedules and cost tables were used in computing the replacement cost of each building and structure.
- determination of the proper quality grade and design factor to be applied to each building to account for variations from the base specifications.
- making a judgment of the overall condition, desirability, and usefulness of each improvement in order to arrive at a sound allowance for depreciation.
- capitalization of net income capabilities into an indication of value in order to determine the loss of value attributable to functional and economic obsolescence.

- addition of the depreciated value of all improvements to the land value and reviewing the total property value in relation to the value of comparable properties.

At the completion of the review phase, the property record cards must be, once again, submitted to clerical personnel for final mathematical calculations and extensions and a final check for completeness and accuracy.

Once the final values have been established for each property, the entire program should be evaluated in terms of its primary objectives. ... do the values approximate a satisfactory level of market value and, what is more important, are the values equitable? Satisfactory answers to these questions can best be obtained through a statistical analysis of recent sales in an appraisal-to-sale ratio study if sufficient sales are available.

To perform the study, it is necessary to take a representative sampling of recent valid sales and compute the appraisal-to-sale ratio for each of the sales. If the sample is representative, the computed median appraisal-to-sale ratio will give an indication of how close the appraisals within each district approximate the market value. This is providing, of course, that the sales included represent true market transactions. It is then necessary to determine the deviation of each individual appraisal-to-sale ratio from the median ratio and to compute either the average or the standard deviation, which will give an indication of the degree of equity within each individual district. What remains then is to compare the statistical measures across property classes in order to determine those areas, if any, which need to be further investigated, revising the appraisal, if necessary, to attain a satisfactory level of value and equity throughout the entire jurisdiction.

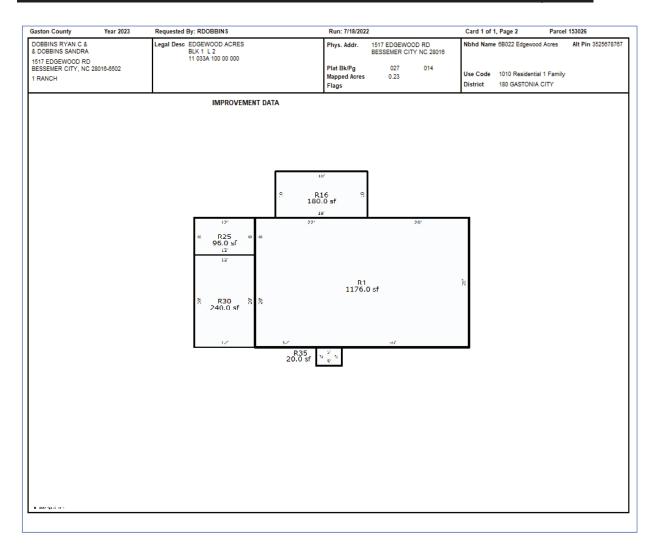

The techniques and procedures set forth herein, if applied skillfully, should yield highly accurate and equitable property valuations, and should provide a sound property tax base. It should be noted, however, that no program, regardless of how skillfully administered, can ever be expected to be error-free. The appraisal must be fine-tuned and this can best be done by giving the taxpayer an opportunity to question the value placed upon his property and to produce evidence that the value is inaccurate or inequitable. During this time, the significant errors will be brought to light, and taking the proper corrective action will serve to further the objectives of the program. What's important in the final analysis is to use all these measures as well as any other resources available to affect the highest degree of accuracy and equity possible.

OPERATING STATEMENT (I&E)

The Operating Statement (I&E) is designed to collect and analyze income and expense information on income producing properties. With this information, the appraiser is able to estimate value through capitalization of income. The Operating Statement is divided into four major categories: Market Data, Cost Data, Remodeling Data, and Income and Expense Data. The Income and Expense area of the statement is divided into three specialized areas: Apartments, General Commercial (retail, warehousing, industry), and Office Buildings. The purpose of the specific income and expense areas is to allow the property owner/manager space to enter applicable income, expense, and amenity data.

MARKET DATA

Space is provided to enter any sales information for both vacant and improved parcels. In addition, space is provided to enter the value of any personal property, inventories, or licenses that may have been included in the purchase price. Also, space is provided to enter the percent of mortgage, mortgage term, and interest rate.

COST DATA

Space is provided to enter any construction cost information that is available concerning the subject property. When possible, sizes of additions, paving, etc., should be entered under the comments area.

REMODELING DATA

Space is provided to enter the cost and a description of significant remodeling that has been associated with the building, the year of the remodeling, and whether the cost was attributable to the owner or a tenant.

APARTMENTS - OPERATING STATEMENT

Space is provided to enter a detailed current quoted rent per month by unit type. In instances where rents are computed on a square foot basis, space is provided to note the total apartment complex rentable area.

Project amenities and unit built-ins should be noted as to what is included/available in the apartment complex. The owner expense statement includes areas to enter what is paid by the owner and the costs associated for a two-year period. The occupancy percentage should be entered in the space provided. Space is also provided to enter the number of garage/carport spaces available and the monthly rental charge, if applicable.

GENERAL RETAIL, WAREHOUSING, INDUSTRIAL, OTHER- OPERATING STATEMENT

This area is designed to enter income and expense amounts on general retail (retail sales), small industrial, and warehouse type facilities. Space is provided to enter the tenants, floor level, lease term, and floor area of the lease.

Expenses are broken down into the general areas of insurance, taxes, maintenance, and utilities. Actual expense should be entered when available.

OFFICE BUILDING - OPERATING STATEMENT

This area of the operating statement is to enter the applicable income and expense information for office buildings. Space is provided to enter the building total gross area, net rentable area, and lease terms, i.e., on a total gross or net rentable area. The amount of retail area should be entered together with the current occupancy rate. The income statement is designed to quote rent per square foot, based on floor level, and whether escalation of rental clause is included. The expense area is broken down into three major categories: insurance and taxes, building maintenance, and utilities. Actual expense should be entered by category if available.

February 1, 2022

Dear Property Owner/Manager:

Our office is currently working on the countywide reappraisal project that will be implemented January 1, 2023, as required by General Statute 105-286.

Revaluations are mandated in order to establish current and equitable values for assessment purposes. This is achieved through using three approaches to value: cost, market, and income. As the owner or manager of an income producing property, we are asking you to please complete all the information that pertains to the property. This data will assist us with our analysis of income producing properties in general and will insure a reasonable and acceptable basis of income and expense data that may be applied.

The information you supply will be held strictly confidential. Only the Revaluation staff appraisers will have access to this information.

Please return in the enclosed envelope within 14 days or email completed form to Stephanie.Queen@GastonGov.com.

If you have any questions concerning this request, please call (704)810-5837.

Thank you for your assistance,

Stephanie Queen, RES Commercial Appraiser

Gaston County 2023

SHOPPING CENTER INCOME & EXPENSE STATEMENT

Dear Property Owner/Manager:

Our office is currently working on the countywide reappraisal project that will be implemented January 1, 2023, as required by General Statute 105-286.

Revaluations are mandated in order to establish current and equitable values for assessment purposes. This is achieved through using three approaches to value: cost, market, and income. As the owner or manager of a shopping center, we are asking you to please complete all the information that pertains to the property. This data will assist us with our analysis of income producing properties in general and will insure a reasonable and acceptable basis of income and expense data that may be applied.

The information you supply will be held strictly confidential.

SECTION 42 INCOME & EXPENSE STATEMENT

Dear Property Owner/Manager:

Our office is currently working on the countywide reappraisal project that will be implemented January 1, 2023, as required by General Statute 105-286.

Revaluations are mandated in order to establish current and equitable values for assessment purposes. This is achieved through using three approaches to value: cost, market, and income. However, our records indicate this property is associated with Section 42 of the Internal Revenue Code in that tax credits were allocated to this project. Therefore, the income approach is based on restricted rental income per N.C. Gen. Stat. 105.277.16. "A North Carolina low-income housing development to which the North Carolina Housing Finance Agency allocated a federal tax credit under section 42 of the code is designated as a special class of property under Article V, Section 2 (2) of the North Carolina Constitution and must be appraised, assessed, and taxed in accordance for property into consideration in determining the income attributable to the property. The assessor may not consider income tax credit received under section 42 of the Code under G. S. 129.42 in determining the income attributable to the property." Therefore, it is imperative that we receive an income and expense report for the subsidized housing development. In lieu of the form included, you may send a copy of the rent roll and/or Income and Expense statement associated with the property.

We have included a Property Information Form and highlighted the sections that need to be completed. Return to Gaston County Tax Department, Attn: Stephanie Queen, PO Box 1578, Gastonia, NC 28053-9901. Or email to Stephanie.Queen@GastonGov.com Please return within 30 days.

The information you supply will be held strictly confidential. Only the Revaluation staff appraisers will have access to this information.

If you have any questions concerning this request, please call (704)866-3158, Option 2.

Thank you for your assistance,

Stephanie Queen, RES Commercial Appraiser

INDICATED SALE PRICE:

Dear Property Owner:

Congratulations on your recent real estate purchase! We seek your assistance in answering a few questions about the transaction identified above. We ask that you take a few minutes to complete this form and return it in the enclosed envelope. As you know, one of the primary tasks for the Tax Office is to maintain an accurate property sales data file. While deed stamps often provide an indicated sales price, that information does not always provide a clear picture of all the conditions related to the transaction.

All valid sales are included in our sales analysis and are critical in the development of the County's Schedule of Values, Standards and Rules adopted for each county-wide general reappraisal.

We sincerely appreciate your assistance in this all important effort. Your contribution will serve to enhance the County's valuation system in the future.

CLASSIFICATIONS OF SELECTED ITEMS AS REAL OR PERSONAL

N.C. 105-273. Definitions

- (13) "Real property," "real estate," and "land" mean not only the land itself, but also buildings, structures, improvements, and permanent fixtures on the land, and all rights and privileges belonging or in any way appertaining to the property.
- (14) "Tangible personal property" means all personal property that is not intangible and that is not permanently affixed to real property.

In general, machinery and equipment used primarily as part of a manufacturing process (process equipment) is taken as <u>Personal Property</u>. Machinery and equipment which is part of the land or building improvement is taken as Real Property.

NEIGHBORHOOD DELINEATION

INTRODUCTION

This section is provided to establish general guidelines and procedures in the identification (delineation) of residential and commercial neighborhoods.

The definition of neighborhood:

A neighborhood is a set of parcels within a specific geographical area, where the parcels share a high degree of homogeneity, the environment of which has a direct and immediate impact on the value of the parcels within its boundary.

Points of interest:

Ideally, it is the smallest geographic unit that can be defined as a single area in which property characteristics for all parcels are qualitatively homogenous.

Primarily, the term neighborhood is urban and suburban in concept. However, it may be extended to rural areas.

Neighborhoods are characterized by the activities or operations that are carried on within its borders.

The boundaries of a neighborhood must be delineated for the purpose of analysis. There are three distinct types of boundaries:

- 1. Natural, (rivers, creeks, lakes, ravines, undeveloped areas, etc.)
- 2. Manmade, (streets, highways, roads, railroads, subdivision boundaries, etc.)
- 3. Political (city limits, school districts, zoning districts, special districts, etc.)

Four factors in the neighborhood analysis are: physical, economic, government and social. These factors must be analyzed specific to their impact on each neighborhood.

Although size is important in defining a neighborhood, other factors must be considered. A larger size neighborhood has the advantage of better protection from infiltration of inharmonious influences or detrimental property uses from adjoining properties. Small areas may better represent a neighborhood in a control environment with many outside influences.

Purpose

Neighborhood Delineation is a study of forces from outside which could be considered to have an effect on property value; and also conclusions on the typical housing, economic, social and demographic characteristics of the geographic area considered a homogeneous neighborhood. A "neighborhood" for analysis purposes is defined as the largest geographic grouping of properties where the significant economic forces of those properties are generally uniform.

The Neighborhood Data Form serves three (3) main functions:

- 1. To provide an opinion of the typical structure, economic factors and conditions within an area considered a neighborhood. Appraisers use this information to provide a benchmark to compare each property within the neighborhood with each other.
- 2. To provide a generally similar geographic area to use as a statistical base for sales comparison, both during the 2023 Reappraisal and years later, to measure change and update values accordingly.
- 3. Provide a basis to allow development of computer assisted land price tables (CALP).

Significant Characteristics Considered:

- 1. Physical Boundaries
 - a. Natural as rivers, mountains, woods, streams, etc.
 - B. Manmade as roads, highways, railroads, streets, corporation boundaries, etc.
- 2. Housing Characteristics such as type, quality, age, and condition.
 - 3. Occupancy as % of homes owner-occupied or tenant-occupied, and % of vacant structures.
 - 4. Predominant land use and anticipated changes.
 - 5. Typical land size and land valuation.
 - 6. Neighborhood life cycle.
 - 7. Estimates of market value ranges.

INSTRUCTIONS FOR NEIGHBORHOOD DELINEATION FIELD ANALYSIS

- Step 1 Produce large scale maps for the county, which ideally show all streets, roads and significant physical features as rivers, lakes, railroads, etc.
- Step 2 Establish preliminary neighborhood boundaries on base maps using known physical and governmental features as boundaries. A general rule would be to consider all physical separation points, as rivers, arterial streets, corporation lines, lakes, commercial-industrial areas, highways, etc., as a definite neighborhood boundary.
- Step 3 Assemble and analyze supplementary material for the community as available and useful.

Examples would include:

Listing of established subdivisions

Zoning maps and zoning restrictions

Planning department maps - (master development plans)

Census Tract Statistics

School district maps

Redevelopment planning maps and studies

Current and planned utility maps (sewer, public water)

Soil maps, topographic maps, etc.

Real estate sales data from multiple listing service and internal sales verification letters

Industrial plant listing, employment base summaries

Step 4 - Begin the field inspection process by conducting a thorough, street by street, visual inspection throughout the county. Based on physical observation and data collected and analyzed to date, establish individual neighborhood boundaries, recognizing the specific delineation points where the properties begin to represent significant physical and economic changes from adjacent areas.

Step 5 - After establishing boundaries of each neighborhood:

A - Fill out the neighborhood data form and assign an identification number.

B - Post the established neighborhood boundaries and identification numbers to a master map.

Step 6 - Establish final boundaries and permanent neighborhood numbers and post both to the Project Master Map and Individual Field Maps used for field appraisal.

Step 7 – Determine, through manual or computerized analysis, the comparability of all neighborhoods. The theory here is, even though various neighborhoods may be physically separated, if the predominant value analysis characteristics such as value range, housing characteristics, neighborhood type, etc., are similar, then it is desirable to group similar neighborhoods and thereby create a larger sales data base for comparable property value analysis.

SUMMARY - Keep in mind during the neighborhood analysis process, our primary purpose is to use the neighborhoods established to develop a statistical measuring base for pooling and analyzing sales data, and subsequently using this data to determine market value for individual properties via the comparable market data approach.

NEIGHBORHOOD DATA FORM INSTRUCTIONS

NEIGHBORHOOD ID: Enter five (5) numeric and alpha characters.

IDENTIFICATION AND REFERENCE

1. AREA NAME: Enter a descriptive name that the neighborhood is commonly known as:

Examples: Gastonia Downtown, NE Dallas Township, and Cramer Mountain.

- 2. TAXING DISTRICT: The municipal taxing district or township is entered.
- 3. TAXING DISTRICT: The numerical number for the municipal taxing district or township is entered.
- 4. SCHOOL DISTRICT: Enter a descriptive name that the district is known as:

Examples: Hunter Huss, Cherryville, Stuart Cramer.

- 5. SCHOOL DISTRICT: The numerical number for the school district is entered.
- 6. FIRE DISTRICT: The predominant fire district.
- 7. FIRE DISTRICT: The numerical number for the predominant fire district.

BOUNDARIES

8, 10, 12, 14 - NORTH, EAST, SOUTH, AND WEST- on each line to enter the boundaries of the neighborhood. Boundaries may be streets, roads, lakes, town lines, railroads, or in short, any natural or manmade boundaries.

Examples: County Line, Highway 321, Catawba River, etc.

9, 11, 13, 15 - Boundary Codes - enter up to 3 characters for the reason WHY that boundary was selected as a delineation point.

Delineation Codes 1 through 4 are provided on the form.

Examples: Field analysis has revealed that the east boundary should be Catawba River because it is a physical barrier to extension, development, or influence from outside forces to this neighborhood. Enter "1". If Catawba River was considered both a physical and a land use change point, both code "1" and code "4" could be entered. A maximum of three (3) codes may be entered for each boundary. Codes 1 through 4 are used in a vast majority of the cases. Most boundaries are for reasons that will be covered by codes 1-4. There are cases when the standard lot size makes a distinct change to the point that a new neighborhood or sub-neighborhood must be identified as such.

CHARACTERISTICS

Characteristics generally refer to the residential development status of the neighborhood. One choice is required for each item, 16 through 22, enter an X in the appropriate box for each item.

16. TYPE

- 1. Urban neighborhood is a built-up area normally within the city limits of municipality.
- 2. Suburban normally a built-up area located outside the city limits but within normal driving and shopping distance to the urban areas. Could be incorporated or the extraterritorial jurisdiction of an urban area or unincorporated.
- 3. Sub-Division normally a sub-divided and platted area of modern dwellings having highly homogeneous housing characteristic (i.e. similar type, age group, style, quality, value range, etc.). May or may not be incorporated. Example: Willow Creek, Stonewater Bay.
- 4. Rural generally considered to be an area of relatively sparse population, open space normally devoted to farm and/or recreational land use. Always unincorporated. Example: Crowders Mountain Township
- 5. Rural Hamlet normally a small village or town located within a rural area and relatively remote from the urbanized areas of the community. Normally it is an unincorporated district.
- 6. Transitional an area that borders a developed area and provides a buffer zone between developed areas such as urban or suburban and a rural area.

17. PREDOMINANT LAND USE

Select the code that most accurately describes the CURRENT predominant land use. These choices are:

- 1. Residential
- 2. Agricultural
- 3. Commercial
- 4. Industrial
- 5. Other (recreational, governmental, educational, etc.)
- 6. Mixed (Combination of uses.)
- 18. NEIGHBORHOOD LIFE CYCLE As mentioned above, neighborhood analysis presumes that all neighborhoods have a life cycle consisting of:
 - 1. Inception and growth usually rapid.

- 2. Relative equilibrium Rather slow and almost imperceptible change cycle of the mature neighborhood.
- 3. Decline The point of marked decay and disintegration normally associated with almost blighted neighborhoods.
- 4. Revitalization To renew a neighborhood.

Select the code that accurately describes the current stage of neighborhood life cycle.

- 19. SUPPLY/DEMAND select the code which most accurately describes the availability of properties for sale within the subject neighborhood. The choices are:
 - 1. Shortage more buyers available than there are properties for sale.
 - 2. In Balance availability approximately equal to buyer demand.
 - 3. Over Supply More properties available for sale than buyers, and representing a temporary or relatively permanent stagnant market condition.
- 20. DENSITY Select the code which most accurately describes the degree of present population and improvement density. Select from:
 - 1. Low as in rural, recreational, open space land use.
 - 2. Medium as in areas of single family development in the range of 50% to 75% peak development.
 - 3. High as in highly urbanized, virtually 100% developed neighborhoods.
- 21. RATE OF TURNOVER Refers to the number of properties currently bought and sold within the subject neighborhood. Select one of the following:
 - 1. Low Usually less than 5% annually of the residential properties in the neighborhood.
 - 2. Medium- Approximately 5% annually of the residential propitious in the neighborhood.
 - 3. High Significantly more than 10% annually of the residential properties in the neighborhood.
- 22. TYPICAL LOT SIZE Refers to the typical lot size for properties located in the neighborhood, expressed as AC (acres), LT (lot) or SF (square feet).

PREDOMINANT IMPROVEMENT TYPE

- 23. TYPICAL CONDITION Indicates the condition of a majority of residences in the neighborhood. Select the most appropriate normalized neighborhood entry.
- 24. TYPICAL GRADE Indicates the construction quality of the majority of the residences in the neighborhood, or the normalized quality grade of the neighborhood. Select the most appropriate entry. A plus or minus could be applied to the typical grade to further classify the majority of residences in the neighborhood. Enter the most appropriate selection.
- 25. TYPICAL AGE GROUP Indicates the average age expressed in years of the majority of residences in the neighborhood. Select the most appropriate code.
- 26. STRUCTURE TYPE Indicates the most typical use in the neighborhood. Select the most appropriate type.

PREDOMINANT OCCUPANCY

This section deals with an estimate of the current utilization of the typical structures within the neighborhood.

- 27. OCCUPANCY Enter (from 000% to 100%) the estimate of the current utilization of the typical structures within the neighborhood for owner and tenant.
- 28. STATUS Enter (from 000% to 100%) the estimated number of currently unoccupied homes and vacant lots in the neighborhood.

NOTE: Seasonal residences normally occupied at some time during the year should not be considered vacant.

TYPICAL PROPERTY FACTORS

- 29. UTILITIES Used to indicate what utilities are available to the majority of properties in the neighborhood. Select the appropriate code(s).
- 30. STREET OR ROAD Indicates the predominant road type in the neighborhood. Select the appropriate code.

ESTIMATED MARKET VALUE FOR RESIDENTIAL IMPROVED PROPERTY (This activity is to be performed during Phase 2 by Appraisers)

This section represents an estimate by the field analyst of the current market value of the typical residential property within the neighborhood. Generally, it can be said that an area can be considered highly homogeneous if at least 75% of the residential property in the neighborhood falls within the minimum - maximum value range and the value range does not exceed a 25% range from the median value.

Example: Minimum - 25000

Maximum - 35000 Median - 32000

- 31. MINIMUM Enter in \$100 multiples, the estimated minimum market value for the typical property in the neighborhood, after adjusting utilized valid market sales with a time index.
- 32. MAXIMUM Enter in \$100 multiples, the estimated maximum market value for the typical in the neighborhood, after adjusting utilized market sales with a time index.
- 33. MEDIAN Enter in \$100 multiples, the estimated median market value for the typical property in the neighborhood, after adjusting utilized valid market sales with a time index. The median is defined as a measure of central tendency equal to that point in a distribution above which 50% of the values fall and below which 50% of the values fall.

NOTES - Area provided to enter any data that is considered significant enough to possibly alter future neighborhood groupings or market value ranges.

ZONING - Area provided to enter predominate zoning.

The following list consists of defined neighborhoods within Gaston County for residential and commercial properties. New neighborhoods may be created and delineated if new subdivisions are created in the Reappraisal Cycle. Residential neighborhoods are separated into 6 major areas. The six major areas are 1. Cherryville, 2. Dallas, 3 Riverbend, 4. South Point, 5. Gastonia, 6. Crowders Mountain. Commercial Neighborhoods are separated into 16 major areas. The 16 are 1. Bessemer City, 2. Belmont, 3. Crowders Mountain, 4. Cramerton, 5. Cherryville, 6. Dallas, 7. Gastonia, 8. High Shoals, 9. Lowell, 10. Mount Holly, 11. McAdenville, 12. Riverbend, 13. Ranlo, 14. Spencer Mountain, 15. South Point, 16. Stanley.

Note: New neighborhoods will be added due to new subdivisions created during revaluation cycles. These neighborhoods will use the land table models existing in this manual.

LAND VALUATION

LAND TYPES AND DESCRIPTIONS

| Land Type | LAND DESCRIPTIONS | | |
|--------------------------|--|--|--|
| RB) Primary | Site used for an existing building or for potential construction of a building. | | |
| RS) Secondary | Restricted site for an existing building or potential construction of a building. Example: the site of a second house located behind the main house on a particular parcel. | | |
| RU) Undeveloped | Land that is either being actively developed, being prepared for development, or the highest and best use is suitable for and likely to be developed in the near future. Typically located in suburban areas with many active subdivisions and concentrated population centers, but can also be found in rural areas with extra road frontage or pocket areas of construction. Public water and sewer is preferred but is not a requirement. | | |
| RR/RL) Residual/Land | Land that has limited development potential or used as farmland or timberland. | | |
| FP) Flood Plain | Land located within the boundaries of designated 100 year flood plains. Value for Flood Plain Land takes into account part of the topographic features peculiar to this type of property. | | |
| CT) Cell Tower | Land that has a cell tower placed on it. | | |
| CM) Cemetery | Land that is used as cemetery. | | |
| WA) Wasteland | Land which is unsuitable for any practical use. Example: land located in swampy type areas. | | |
| WB) Waterfront Primary | Land which directly adjoins Lake Wylie, Mountain Island Lake, Catawba River, or South Fork River refers to Residential, Commercial, and Industrial Improved Building Sites. | | |
| WS) Waterfront Secondary | Land which directly adjoins Lake Wylie, Mountain Island Lake, Catawba River or South Fork River to Residential, Commercial, and Industrial with restricted building sites or | | |

potential for building sites.

Schedule of Values Gaston County 2023

| WR) Waterfront Residual | Land which directly adjoins Lake Wylie, Mountain Island Lake, Catawba River or South Fork River that has limited development potential. |
|----------------------------|---|
| WU) Waterfront Undeveloped | Land which directly adjoins Lake Wylie, Mountain Island Lake, Catawba River, or South Fork River is either being actively developed, being prepared for development, or the highest and best use is suitable for and likely to be developed in the near future. |
| WSU) Waterfront Submerged | Land which is directly under Lake Wylie, Mountain Island Lake, Catawba River, or South Fork River. |
| AP) Apartment Primary | Site for an apartment building or potential apartment building. |
| AS) Apartment Secondary | Restricted site for an apartment building or potential apartment building. |
| AU) Apartment Undeveloped | Apartment land which suitable for development or ready for development. |
| AR) Apartment Residual | Apartment land which as nominal value, typically land which only has value relative to its contribution to the overall parcel value. |
| CB) Commercial Primary | Site for a commercial building or potential commercial building typically zoned commercial or already has commercial building. |
| CS) Commercial Secondary | Restricted land for a commercial building or potential commercial building typically zoned commercial or already has commercial building. |
| CR) Commercial Residual | Commercial land which has nominal value, typically land which only has value relative to its contribution to the overall parcel value. |
| CU) Commercial Undeveloped | Vacant Commercial Land which is suitable in size, zoning, and location for commercial development. |
| CL) Commercial Lake | Lake which is used for commercial fishing. |
| GC) Golf Course Land | Land that is used for golf course, not including club house or extra amenities. |

Gaston County 2023

| IB) Industrial Primary | Land for an industrial building or potential industrial building typically zoned industrial or already has an industrial building. |
|----------------------------|--|
| IS) Industrial Secondary | Restricted land for an industrial building or potential industrial building typically zoned industrial or already has an industrial building. |
| IR) Industrial Residual | Industrial land which has nominal value, typically land which only has value relative to its contribution to the overall parcel value. |
| IU) Industrial Undeveloped | Vacant Industrial Land which is suitable in size, zoning and location for industrial development. |
| CA) Common Area | Allocation of value to individual properties located in townhouse, condominium or housing developments. Value includes interest in all common areas, e.g. parking areas, pools, tennis courts, etc.; as well as land interest. Value of all common area amenities will be distributed among all properties within a given neighborhood or complex. |
| MB) Mixed Primary | Site for a building or potential building that has mixed uses. |
| MS) Mixed Secondary | Restricted site for a building or potential building that has mixed uses. |
| MR, ML) Mixed Residual | Land that has limited development potential. |
| MU) Mixed Undeveloped | Vacant land which is suitable in size, zoning, and location for mixed use development. |

VALUATION GUIDELINES

- 1) Rural Remote or sparsely developed areas of the county where much of the land is being actively farmed or lying idle. Turnover is infrequent and development is generally limited to major highway intersections and rural hamlet communities. Public water may or may not be available. The majority of homes and businesses in rural areas are served by individual wells and septic systems.
- 2) Suburban Areas in the county in which development is occurring or has reached equilibrium stage. Includes concentrated communities, surrounding cities, and towns. Pockets of commercial and industrial properties are prevalent. Public water is normally available and in some cases sanitary sewer services exist but are not required.

- 3) Urban Areas within or immediately surrounding cities or towns with a high density of housing, commercial and industrial properties. Land is almost always bought and sold with the intent to develop. Turnover is frequent and development is rapid. Public water and sewer are readily available.
- 4) Subdivisions Areas which have been divided into plots with roadways for the purpose of development for residential, commercial, or industrial. Subdivisions may have extra restrictions besides governmental restrictions. Public water may or may not be available and in some cases sanitary sewer services exist.

RESIDENTIAL LAND MODELS

Lot Model

| Model | RB | RS | RU | RL,RR |

BASE RATE LAND VALUATION TECHNIQUE

The Base Rate Land Valuation Technique allows the appraiser to establish land rates using either a price per acre, price per square foot or price per lot for each parcel located within an individual neighborhood unit. This method also allows the appraiser to develop base land sizes for each land segment type within the neighborhood.

RESIDENTIAL LAND VALUATION

Lot Valuation

Land valued on the lot valuation technique places a flat value on the parcel. Typical land valued by this technique ranges from a tenth of an acre to one acre. (The word lot and site in this manual are synonymous.)

EXAMPLE: Lot Model #35

| Land Type | Lot Unit | Base Rate |
|-----------|----------|-----------|
| | | (Per Lot) |
| LT RB | 1.00 | \$20,000 |

Subject parcel consists of one half acre of land inside Gaston Subdivision platted for houses. The lot valuation technique will value the parcel in the following manner:

lunit consisting of .50 acres multiplied by base price per lot equals \$20,000. A second parcel of land in the same subdivision consisting of .65 of an acre would price the parcel as lunit consisting of .65 acres multiplied by base price per lot equals \$20,000.

Acreage Valuation

Land valued on the acreage valuation technique calculates the value of a parcel based on the breakdown of the type of land and the size of the land. Land typically sales similar to the theory of "Economy of Scale" in that as you increase the size of land the rate per acre would decrease. For example, a 10 acre tract of land may sell for \$80,000 or \$8,000 an acre and a 20 acre tract of land in the same area may sale for \$140,000 or \$7,000 an acre. This is a reduction of \$1,000 per

acre due to the size increase of the parcel. To account for this difference in the rate for the size, we adjust the rate up or down from the average size of an area. The following is a list of the types of land and example of how it would be priced.

Land Type RB and RS will always be based on a 1 acre base size. If there is more than an acre classified under these two codes it will calculate on the base rate with no adjustment. If it is less than an acre it will multiply the difference from the base size an actual size by 50% of the base rate and deduct this amount from the base rate.

Acreage model #33 RB rate is \$20,000.

.25 acres \$12,500 .75 acres \$17500 2.00 acres \$40,000 .50 acres \$15,000 1.00 acre \$20,000

Ex. Parcel A has .45 acres of land. The calculation is as follows: \$20,000 base rate – [(1.00 ac. base size -.45 ac. actual size) X (50% of \$20,000 base rate)] = Total value

20,000-[(1.00-.45) X (50% X 20,000)] = TV

20,000-[.55 X 10,000] = TV

20,000-5,500 = 14,500 Parcel A has a land value of \$14,500.

Land Type RU, RL and RR will be based on base sizes of 1, 3, 5, 10, 15 and 20 acres. Typically, 15 and 20 acre base sizes are in rural areas. The rest are generally in suburban or urban areas. If there are more acres than the base size the land rate will be reduced by 40% of the base rate. Land that is less than the base size and has a standard base size of 1, 3, or 5 acres there is no increase in the base rate. If the standard base size is 10, 15, or 20 acres the rate will increase by .4% per difference in actual size and the base size.

Acreage model #33 RR rate is \$6,400. If you use the 15 acre base size the value would look as follows:

| Size | Total | Rate per | Size | Total | Rate per |
|------|----------|----------|------|-----------|----------|
| | Value | acre | 3126 | Value | acre |
| 5 | \$32,250 | \$6,450 | 20 | \$115,200 | \$5,760 |
| 10 | \$64,125 | \$6,412 | 50 | \$230,400 | \$4,608 |
| 15 | \$96,000 | \$6,400 | 100 | \$422,400 | \$4,224 |

Ex. Parcel A has 35 acres of land and is located in model #33 with 15 acre base. The calculation is as follows: (\$6,400 base rate X 15 acres base size) + [(35.00 ac. actual size - 15 ac. base size) X (60% of \$6,400 base rate)] = Total value

 $6,400 \times 15 + [(35.00-15.00) \times (60\% \times 6,400)] = TV$

 $$96,000 + [20.00 \times $3,840] = TV$

\$96,000 + \$76,800 = \$172,800 Parcel A has a land value of \$172,800 or \$4937 per acre.

Land Type FP will be based on base sizes of 1, 3, 5, 10, 15 and 20 acres. Typically 15 and 20 acre base sizes are in rural areas. The rest are generally in suburban or urban areas. If there are more acres than the base size the land rate will be reduced by 40% of the base rate. Land that is less than the base size there is no increase in the base rate. Acreage model #33 FP rate is \$3,200. If you use the 15 acre base size the value would look as follows:

| Size | Total | Rate per | Size | Total | Rate per |
|------|----------|----------|------|----------|----------|
| Size | Value | acre | 3126 | Value | acre |
| 5 | \$16,000 | \$3,200 | 20 | \$57,600 | \$2,880 |

| 10 | \$32,000 | \$3,200 | 50 | \$115,200 | \$2,304 |
|----|----------|---------|-----|-----------|---------|
| 15 | \$48,000 | \$3,200 | 100 | \$211,200 | \$2,112 |

Ex. Parcel A has 35 acres of FP land and is located in model #33 with 15 acre base. The calculation is as follows: (\$3,200 base rate X 15 acres base size) + [(35.00 ac. actual size – 15 ac. base size) X (60% of \$3,200 base rate)] = Total value

 $3,200 \times 15 + [(35.00-15.00) \times (60\% \times 3,200)] = TV$

 $48,000 + [20.00 \times 1,920] = TV$

\$48,000 + \$38,400 = \$86,400 Parcel A has a land value of \$86,400 or \$2,468 per acre.

Land Type WA, CM, GC, CT, SL and CL will multiply the base rate by the actual size of the parcel. This list of land types could be commercial or residential.

Ex. Parcel A has 35 acres of WA land and is located in model #33. The calculation is as follows: \$500 base rate x 35 acres actual size = Total value

 $$500 \times 35 = $17,500$ Parcel A has a land value of \$17,500 or \$500 per acre

Waterfront Acreage Valuation

Waterfront land valued on the acreage valuation technique calculates similar to the way the basic acreage calculation method. The following is a list of the types of waterfront land and example of how it would be priced.

Land Type WB and WS will always be based on a 1 acre base size. If there is more than an acre classified under these two codes it will calculate on the base rate with a 50% rate adjustment for any size above 1 acre. If it is less than an acre it will multiply the difference from the base size and actual size by 15% of the base rate and deduct this amount from the base rate.

Waterfront acreage model #21 WB rate is \$200,000.

.25 acres \$177,500 .75 acres \$192,500 2.00 acres \$300,000 .50 acres \$185,000 1.00 acre \$200,000

Ex. Parcel A has .45 acres of waterfront land. The calculation is as follows: 200,000 base rate – [(1.00 ac. base size -.45 ac. actual size) X (15% of 200,000 base rate)] = Total value

 $200,000-[(1.00-.45) \times (15\% \times 200,000)] = TV$

 $200,000-[.55 \times 30,000] = TV$

\$200,000-\$16,500 =\$183,500 Parcel A has a land value of \$183,500.

Land Type WU and WR base size will always be 5 acres. If there are more acres than the base size the land rate will be reduced by 50% of the base rate. Land that is less than the base size has no increase in the base rate.

Waterfront acreage model #21 WR rate is \$20,000. Value would look as follows:

| Size | Total | Rate per | Size | Total | Rate per |
|------|-----------|----------|------|-----------|----------|
| | Value | acre | 3126 | Value | acre |
| 1 | \$20,000 | \$20,000 | 15 | \$200,000 | \$13,333 |
| 5 | \$100,000 | \$20,000 | 25 | \$300,000 | \$12,000 |
| 10 | \$150,000 | \$15,000 | 50 | \$550,000 | \$11,000 |

Ex. Parcel A has 35 acres of waterfront residual land and is located in model #21 with 5 acre base. The calculation is as follows: (\$20,000 base rate X 5 acres base size) + [(35.00 ac. actual size -5 ac. base size) X (50% of \$20,000 base rate)] = Total value

 $20,000 \times 5 + [(35.00-5.00) \times (50\% \times 20,000)] = TV$

 $100,000 + [30.00 \times 10,000] = TV$

\$100,000 + \$300,000 = \$400,000 Parcel A has a land value of \$400,000 or \$11,428 per acre.

Land Type WSU will multiply the base rate by the actual size of the parcel.

Parcel A has 5 acres of WSU land and is located in model #21. The calculation is as follows: \$100 base rate x 5 acres actual size = Total value

100 X 5 = 500 Parcel A has a land value of 00 or 100 per acre

COMMERCIAL LAND VALUATION

Square Foot Valuation

Land Type CB, CS, CR, CU, IB, IS, MB and MS will be based on base sizes of 5000, 10,000, 20,000 and 45,000 square feet. If the land has more square feet than the base size the land rate will be reduced by 50% of the base rate. Land that has less square feet than the base size there will have no increase in the base rate.

Square Foot model #7 CB rate is \$5.00. If you use the 45000 square foot base size the value would look as follows:

| Size | Total Rate per | | Size | Total | Rate per |
|--------|----------------|---------|---------|-----------|----------|
| Size | Value | sq. ft. | 3126 | Value | sq. ft. |
| 20,000 | \$100,000 | \$5.00 | 60,000 | \$262,500 | \$4.375 |
| 40,000 | \$200,000 | \$5.00 | 80,000 | \$312,500 | \$3.906 |
| 45,000 | \$225,000 | \$5.00 | 100,000 | \$362,500 | \$3.625 |

Ex. Parcel A has 50,000 sq. ft. of land and is located in model #7 with 45,000 sq. ft. base size. The calculation is as follows: (\$5.00 base rate x 45,000 sq. ft. base size) + [(50,000sq. ft. actual size -45,000 sq. ft. base size) X (50% of \$5.00 base rate)] = Total value $5.00 \times 45,000 + [(50,000-45,000) \times (50\% \times 5.00)] = TV$ $225,000 + [5,000 \times 2.50] = TV$

\$225,000 + \$12,500 = \$237,500 Parcel A has a land value of \$237,500 or \$4.75 per sq. ft.

Acreage Valuation

Land valued on the acreage valuation technique calculates the value of a parcel based on the breakdown of the type of land and the size of the land. To account for the difference in the rate for the size, we adjust the rate up or down from the average size of an area. The following is a list of the types of land and example of how it would be priced.

Land Type CB, CS, CR, CU, MR, MU, and ML will have a base size of 1 acre. If there are more acres than the base size the land rate will be reduced by 50% of the base rate. Land that is less than the base size no increase in the base rate will be added.

Acreage model #8 CU rate is \$100,000 and the value would look as follows:

| Size | Total | Rate per | Size | Total | Rate per |
|------|-----------|-----------|------|-------------|----------|
| Size | Value | acre | 3126 | Value | acre |
| 1 | \$100,000 | \$100,000 | 20 | \$1,050,000 | \$52,500 |
| 5 | \$300,000 | \$60,000 | 50 | \$2,550,000 | \$51,000 |
| 10 | \$550,000 | \$55,000 | 100 | \$5,050,000 | \$50,500 |

Ex. Parcel A has 35 acres of CU land and is located in model #8 1 acre base. The calculation is as follows: (\$100,000 base rate x 1 acres base size) + [(35.00 ac. actual size - 1 ac. base size) X (50% of \$100,000 base rate)] = Total value

 $100,000 \times 1 + [(35.00-1.00) \times (50\% \times 100,000)] = TV$

 $100,000 + [34.00 \times 50,000] = TV$

100,000 + 1,700,000 = 1,800,000 Parcel A has a land value of 1,800,000 or 1,800,000 or 1,800,000 per acre.

Land Type IB, IS, IR and IU will have a base size of 5 or 10 acres. If there are more acres than the base size the land rate will be reduced by 50% of the base rate. Land that is less than the base size, no increase in the base rate will be added.

Acreage model #8 IU rate is \$25,000 and 10 acre base the value would look as follows:

| Size | Total | Rate per | Size | Total | Rate per |
|------|-----------|----------|------|-------------|----------|
| | Value | acre | 3126 | Value | acre |
| 1 | \$25,000 | \$25,000 | 20 | \$375,000 | \$18,750 |
| 5 | \$125,000 | \$25,000 | 50 | \$750,000 | \$15,000 |
| 10 | \$250,000 | \$25,000 | 100 | \$1,375,000 | \$13,750 |

Ex. Parcel A has 35 acres of IU land and is located in model #8 10 acre base. The calculation is as follows: (\$25,000 base rate x 10 acres base size) + [(35.00 ac. actual size – 10 ac. base size) X (50% of \$25,000 base rate)] = Total value

 $25,000 \times 10 + [(35.00-10.00) \times (50\% \times 25,000)] = TV$

 $250,000 + [25.00 \times 12,500] = TV$

\$250,000 + \$312,500 = \$562,500 Parcel A has a land value of \$562,500 or \$16,071 per acre.

Land Type AP, AS, AR, MB and MS will always be based on a 1 acre base size. If there is more than an acre it will calculate on the base rate with no adjustment in the rate. If it is less than an acre it will multiply the difference from the base size an actual size by 50% of the base rate and deduct this amount from the base rate.

Acreage model #8 AP rate is \$60,000.

Ex. Parcel A has .45 acres of land. The calculation is as follows: \$60,000 base rate – $[(1.00 \text{ ac. base size } -.45 \text{ ac. actual size}) \times (50\% \text{ of } $60,000 \text{ base rate})] = Total value$

\$60,000-[(1.00-.45) X (50% X \$30,000)] =TV

\$60,000-[.55 X \$30,000] =TV

\$60,000-\$16,500 =\$43,500 Parcel A has a land value of \$43,500.

Land Type FP will have a base size of 5 acres. If there are more acres than the base size the land rate will be reduced by 50% of the base rate. Land that is less than the base size will have no increase in the base rate. Acreage model #8 FP rate is \$4,000. If you use the 5 acre base size the value would look as follows:

| Size | Total | Rate per | Size | Total | Rate per |
|------|----------|----------|------|-----------|----------|
| Size | Value | acre | SIZE | Value | acre |
| 5 | \$20,000 | \$4,000 | 20 | \$50,000 | \$2,500 |
| 10 | \$30,000 | \$3,000 | 50 | \$110,000 | \$2,200 |
| 15 | \$40,000 | \$2,667 | 100 | \$210,000 | \$2,100 |

Ex. Parcel A has 35 acres of FP land and is located in model #8. The calculation is as follows: (\$4,000 base rate x 5 acres base size) + [(35.00 ac. actual size - 5 ac. Base size)

 $X (50\% \text{ of } \$4,000 \text{ base rate})] = Total value}$

 $4,000 \times 5 + [(35.00-5.00) \times (50\% \times 2,000)] = TV$

 $20,000 + [30.00 \times 2,000] = TV$

\$20,000 + \$60,000 = \$80,000 Parcel A has a land value of \$80,000 or \$2,285 per acre.

LAND INFLUENCE FACTORS

The technique of land pricing, as described in other sections of this manual, provides for the development of unit land rates for all classes of real property within a given area or neighborhood. These land rates are developed from verified, recent sales and are expected to reflect market value for various prevalent land types as of the effective valuation date for each given area.

It is significant to point out that assigned land rates are based on typical or normal conditions for that class of property and land type within a specific neighborhood or area. It is likely that some number of specific parcels within a neighborhood will have unique factors affecting the value of that land parcel. These "Land Influence Factors" may affect the value of a specific parcel beneficially or detrimentally. I.E., plus or minus compared to the norm for the neighborhood.

Proper appraisal practice indicates that a land rate adjustment or "Land Influence Factor" should be applied by the review appraiser to properly reflect the unique considerations for a parcel with significant physical or economic characteristics, deviating from the normal conditions reflected by the neighborhood land rates.

The primary goal of a Revaluation Program is equalization; it is strongly recommended that users of this manual exercise proper judgment and caution in the application of land influence factors.

Land Influence Factor Guidelines

Road Types

This category lists the adjustments for the different types of access to the subject parcel.

| Code | Description | Factor |
|------|------------------|--------|
| PV | Paved Road | 100% |
| GR | Gravel/Dirt Road | 90% |

| PPV | Private Paved Right of Way Road | 90% |
|-----|---------------------------------------|------|
| PA | Private Right of Way | 75% |
| NA | No Access | 50% |
| WPV | Waterfront Paved Road | 100% |
| WGD | Waterfront Gravel/Dirt Road | 95% |
| WPR | Waterfront Private Paved Right of Way | 95% |
| WPA | Waterfront Private Right of Way | 90% |
| WNA | Waterfront No Access | 75% |

Topography

This category allows the reviewing appraiser to modify land values to reflect poor topography and the potential resistance of the market as to its suitability for construction. Normally, the presence of a primary improvement on a site gives evidence that topography problems have been corrected. An improved lot is not adjusted or slightly adjusted for topography. A topography influence, however, may be needed in significant cases of unimproved lots or tracts where poor topography represents an actual detriment to the presumed utilization of the parcel. Topography issues such as irregular land contour, poor drainage, potential subsidence, subsurface rock ledges, potential erosion, and floodplain areas can negatively impact the value of land. The following scenarios represent a guide for allowable topography adjustments.

A normal topography occurrence, where a problem has been corrected or is considered insignificant, would need no adjustment. Topography considered slight, where an issue is deemed curable and somewhat less desirable than a typical lot or site, would be adjusted between 10% and 25%. Moderate topography, where a lot or site may not be usable until some correction is completed, would be adjusted between 25% and 50%. Severe topography, where corrections are made at significant cost or is not feasible for any remediation, would be adjusted between 50% and 90%. The following is presented as topography factor guide:

| Code | Description | Factor |
|------|-------------------------|--------|
| TP | Topography | 0-99% |
| SLT | Slight | 75-99% |
| MOD | Moderate | 50-75% |
| SEV | Severe | 10-50% |
| FE | Erosion | 0-99% |
| CDR | Culvert/Drainage/Stream | 0-99% |

Shape or Size

Shape or size factor is normally a negative adjustment to account for loss of value to a parcel due to highly irregular shape or insufficient size for the presumed utilization of the parcel. The following is presented as a shape/size factor guide:

| Code | Description | Factor |
|------|-----------------|--------|
| IRR | Irregular Shape | 0-99% |
| SP | Shape | 0-99% |
| SZS | Size | 0-99% |

Restrictions

A negative land influence adjustment for restrictions is applicable for cases where the property is subject to a legal or physical restriction to its utilization. Typical examples would include: Utility easements, such as power lines and sewer lines. Zoning or deed restrictions to the property, limiting the utilization to a less than normal use for typical lots in the neighborhood. Physical barriers to the property such as bridges, highway medians, fences, or abutments.

The following is presented as a land influence factor guide for restrictions:

| Code | Description | Factor |
|------|-----------------------|--------|
| CNV | Conservation Easement | 0-99% |
| CO | Contamination | 0-99% |
| EAS | Easement | 0-99% |
| NP | No Perc | 25% |
| RE | Restriction | 0-99% |
| RW | Right of Way | 0-99% |

Economic Mis-Improvement

This category is reserved as a reviewer's judgment of the comparative loss of value in land (either under-improvement or over-improvement). In essence, this judgment is expressing the appraiser's opinion that the existing structure represents an encumbrance to the full utilization of the land. The application of a misimprovement factor for Residential/Agricultural property is possible but very rare. Most instances occur in commercial or industrial situations where market evidence indicates a different economic utilization of the land than the current utilization. It is important to recognize in the application of economic mis-improvement factors that the land is presumed to be valued on the bases of typical "highest and best" utilization and the existing structure is non-contributory to this most economical utilization. Obviously, vacant tracts are not encumbered by any structure; therefore, vacant tracts are not subject to economic mis-improvement factors. Further, the appraiser should recognize that the economic mis-improvement condition is "curable," i.e., if the structure is removed, the previously applied economic misimprovement factor is normally no longer applicable. The following is presented as a land influence factor guide for restrictions:

| Code | Description | Factor |
|------|--------------------------|--------|
| ECO | Economic | 0-99% |
| EMI | Economic Mis-improvement | 0-99% |

Corner and/or Alley Influence

This category is reserved for the recognition of the enhancement in land value attributable to the potential utilization of a corner lot, over and above the value of an otherwise comparable inside lot. The enhancement due to the presence of a rear or side alley is normally common to all lots in a given area or block. Therefore, recommended procedure for enhancement due to alley influence, if any, is to consider this factor in the land rate itself. The amount of enhancement, if any, to a corner lot must be based on the individual merits of each corner location. Normally, corner influence is not applicable to Residential/Agricultural property. Corner influence factors should be applied to only those cases of commercial or industrial property where the corner is an actual enhancement to the land.

Following is presented as a guide for Corner Influence Factors:

| Code | Description | Factor |
|------|------------------|----------|
| CAI | Corner/Alley | 100-200% |
| CIF | Corner Influence | 100-200% |

View Influence

This factor is normally a positive adjustment for lots or parcels where the land value is significantly enhanced by the presence of a scenic or waterfront view when compared to similar lots in the area where no significant view is present. This factor also applies to golf course lots. It is highly recommended that the appraiser exercise due caution in the application of view influence. It is useful to remember that, while the subject may have an appealing view, if this condition is common to most parcels in the area, then comparatively there is probably no real view enhancement. The appraiser should also consider the permanency of the view, i.e., the probability of potential obstruction.

The following is a View Influence Factor Guide:

| Code | Description | Factor |
|------|----------------------|---------|
| GV | Golf Course View/Lot | 10-200% |
| VW | View | 10-200% |
| WFV | Waterfront View | 10-200% |

Other Influence

The following is a list of influences not listed previously. The influences can be either negative or positive.

| Description | Factor |
|---------------------|--|
| Associated Parcel | 0-99% |
| Cemetery | 0-99% |
| Detention Pond | 0-99% |
| Gaston/York Line | 0-99% |
| Location | 0-200% |
| Ingress/Egress | 0-99% |
| Outparcel | 100-200% |
| Special (See Notes) | 100-200% |
| Waterfront Cove | 0-99% |
| Waterfront Frontage | 0-200% |
| | Associated Parcel Cemetery Detention Pond Gaston/York Line Location Ingress/Egress Outparcel Special (See Notes) Waterfront Cove |

CONSERVATION EASEMENTS

A conservation easement is a voluntary restriction of one's real property rights for the purpose of preserving land from development and for future benefit as scenic areas, wildlife habitat, and open space for a sustainable natural environment.

Due to the uniqueness of both land and property owner, it is necessary to tailor a conservation easement equally as unique. Each conservation easement must be reviewed and analyzed to determine the relinquished rights as well as the allowable exceptions in order to equitably reflect the value for the property.

All pertinent data that might be shared by either the conservation easement grantor or grantee will be considered by the Gaston County Tax Office in the appraisal of any property encumbered by a conservation easement. The following section is a portion of North Carolina General Statute 105 known as the Machinery Act of North Carolina.

§ 105-317. Appraisal of real property; adoption of schedules, standards, and rules.(a) Whenever any real property is appraised it shall be the duty of the persons making appraisals: (1)In determining the true value of land, to consider as to each tract, parcel, or lot separately listed at least its advantages and disadvantages as to location; zoning; quality of soil; waterpower; water privileges; **dedication as a nature preserve; conservation or preservation agreements**; mineral, quarry, or other valuable deposits; fertility; adaptability for agricultural, timber-producing, commercial, industrial, or other uses; past income; probable future income; and any other factors that may affect its value except growing crops of a seasonal or annual nature.

It is the intent of this portion of the 2023 Schedule of Values, Standards, and Rules to comply with the spirit of the aforementioned statute and to preserve both fair and equitable assessments among all properties within Gaston County.

All adjustments reflecting relinquished rights shall be made based on the land type for the parcel. If the deed allows for part of the land to have a house or houses the land will be classified as RB for the amount of land with no adjustments. If land is classified as RU and cannot be subdivided the entire 25% for right to subdivide will be used. If land is classified as RR or RL and cannot be subdivided only 10% will be used. If land is classified FP the right to build would not be adjusted since floodplain is typically not buildable. All other property rights considered will be based on the restriction of the easement.

| PROPERTY OWNER NBHD-PARCEL NUMBER ACREAGE OF PARCEL ACREAGE AFFECTED BY EASEMENT | John Public 00000-00000 0 0 | | |

| TOTAL | | 100% | 0.00% | 0% |
|---|--|------------|-----------------------------|----|
| MARKET VALUE BEFORE EASEMENT LOSS IN VALUE FROM EASEMENT | | \$0 \$0 | TOTAL TRACT VALUE \$0 | |
| REMAINING MARKET VALUE WITH EASEMENT IN PLACE | | \$0 | | |
| DATE ESTIMATE CALCULATED CALCULATED BY: | | | | |

MINERAL RIGHTS

Real Property from which mineral rights are separated shall be valued as a separate entity. The mineral rights value is determined from analysis of similar sales of mineral rights located in the area and is deducted from the real property to determine market value for the remaining rights. See example below:

Parcel A is a 50 acre tract valued at \$5,000 an acre for a total of \$250,000. Parcel A's minerals were separated by a deed and sold for \$50,000. The value for the mineral rights is calculated at a \$1,000 an acre. The mineral rights would then become parcel B with a value of 50 acres at \$1,000 per acre or \$50,000 total value. This mineral rights value would then be deducted from parcel A's market value for a new total market value for parcel A of \$200,000.

COST APPROACH TO VALUE

ESTIMATING REPLACEMENT COST NEW

The informed buyer is not justified in paying anything more for a property than what it would cost him to acquire an equally desirable substitute property. Likewise, the upper limit of value of most improvements is the cost of reproducing an equally desirable substitute improvement. It follows, then, that a uniform starting point for an Equalization Program is to determine the Replacement Cost New of each and every improvement.

REPLACEMENT COST

Replacement Cost is the current cost of producing an improvement of equal utility to the subject property; it may or may not be the cost of reproducing a replica property. The distinction being drawn is one between Replacement Cost, which refers to a substitute property of equal utility, as opposed to Reproduction Cost, which refers to a substitute replica property.

The Replacement Cost of an improvement includes the total cost of construction incurred by the builder, whether preliminary to, during the course of, or after completion of its construction. Among these are materials, labor, all sub-contracts, builder's overhead and profit, architectural and engineering fees, consultation fees, survey and permit fees, legal fees, taxes, insurance, and the cost of interim financing.

PRICING SCHEDULES

Pricing schedules and related cost tables are included in this manual to assist the appraiser in arriving at accurate estimation of Replacement Cost New. They have been developed by applying unit-in-place costs to the construction of specified hypothetical or model buildings. Application of the schedules involves the selection of the model which most nearly resembles the subject building and adjusting its price to compensate for all significant variations.

Pricing schedules are included for various types of Residential, Agricultural, Institutional, Commercial and Industrial structures.

Cost adjustments for the variations which are most frequently encountered in a particular type building are included. Adjustments for other variations may be made by using either the other Feature Cost Tables or other appropriate schedules.

SELECTING THE PROPER QUALITY GRADE

The quality of materials and workmanship is the one most significant variable to be considered in estimating the replacement cost of a structure. Two buildings may be built from the same general plan, each offering exactly the same facilities and with the same specific features, but with widely different costs due entirely to the quality of materials and workmanship used in their construction. For instance, the cost of a dwelling constructed of high quality materials and

with the best of workmanship throughout can be more than twice that of one built from the same floor plan, but with inferior materials and workmanship.

The schedules included in this manual have been developed to provide the appraiser with a range of grades comprehensive enough to distinguish all significant variations in the quality of materials and workmanship which may be encountered; the basic specifications for each grade as to the type of facility furnished remain relatively consistent throughout, and the primary criterion for establishing the grade being the overall quality of materials and workmanship.

The majority of buildings erected fall within a definite class of construction, involving the use of average quality of materials with average quality of workmanship. This type of construction being the most common, it can readily be distinguished by the layman as well as the professional appraiser. Consequently, better, or inferior quality of construction can be comparatively observed. The quality grading system and pricing schedules in this manual are keyed to this obvious condition; the basic grade being representative of that cost of construction using average quality of materials with average quality workmanship. The principal Quality Grade classifications are as follows:

| Grade AAA | Superior Quality |
|-----------|--------------------------|
| Grade AA | Excellent Quality |
| Grade A | Very Good Quality |
| Grade B | Good Quality |
| Grade C | Average Quality |
| Grade D | Fair Quality |
| Grade E | Poor Quality |

The seven grades listed above will cover the entire range of construction quality, from the poorest quality to the finest quality.

The general quality specifications for each grade are as follows:

| AAA Grade | Buildings generally having an exceptional architectural style and design, |
|-----------|---|
| | constructed with the finest quality materials and custom workmanship. |
| | Superior quality interior finish, built-in features, deluxe heating system, |
| | plumbing and lighting fixtures. |

AA Grade Buildings generally having an outstanding architectural style and design, constructed with the finest quality materials and workmanship. Superior quality interior finish, built-in features, deluxe heating system, plumbing and lighting fixtures.

A Grade Architecturally attractive buildings constructed with excellent quality materials and workmanship throughout. High quality interior finish and built-in features. Deluxe heating system and very good grade plumbing and lighting fixtures.

Gaston County 2023

B Grade Buildings constructed with good quality materials and above

average workmanship throughout. Moderate architectural treatment. Good quality interior finish and built-in features.

Good grade heating, plumbing, and lighting fixtures.

C Grade Buildings constructed with average quality materials and workmanship

throughout, conforming to the base specifications used to develop the pricing schedule. Minimal architectural treatment. Average quality interior finish and built-in features. Standard grade heating, plumbing,

and lighting fixtures.

D Grade Buildings constructed with economy quality materials and fair

workmanship throughout. Void of architectural treatment. Cheap quality interior finish and built-in features. Low grade heating, plumbing, and

lighting fixtures.

E Grade Buildings constructed with a very cheap grade of materials, usually

"culls" and "seconds" and very poor quality workmanship resulting from unskilled, inexperienced, "do-it-yourself" type labor. Low grade heating,

plumbing, and lighting fixtures.

In order to facilitate using this grading system and, again to promote and maintain uniformity in approach, the value relationship of grade to grade as just described has been incorporated into the development of the base specifications relating to each schedule used in the manual.

Note: The appraiser must exercise extreme caution not to confuse the concepts "quality" and "condition" when selecting the proper grade. This is especially applicable to older buildings, wherein a deteriorated condition can have a noticeable effect on their physical appearance. A building will always retain its initial grade of construction, regardless of its existing deteriorated condition. The Quality Grade ultimately selected must reflect that original built-in quality and the selection of that grade cannot be influenced in any way by the physical condition of the building.

APPLYING THE PROPER GRADE FACTOR

Grading would be a relatively simple process if all buildings were built to conform to the quality grade specifications outlined above. The fact is, however, that this ideal condition does not exist. It is not unusual for any conventional building to be built incorporating construction qualities that fall between the established grade levels. The grading system in this manual has been designed in such a way as to provide the appraiser with a method for accounting for such variations by establishing intermediate grades.

If the Subject building is judged to be of a better or inferior quality than the actual grade levels, a grade factor of plus (+) or minus (-) should be applied, i.e., C+ would be better than a straight "C" Grade, B- poorer than a straight "B" Grade, etc.

There is rarely a clear-cut designation of a specific grade factor. The appraiser will generally select a range, such as C+ to B-, and then weigh the various quality factors exhibited in the construction in order to select the proper factor.

Following the above procedures results in the full range of Residential Quality Grade Factors, examples of these factors are listed below.

| AAA (+) 350% | 6 A | 155% | C | 100% | E | 55% |
|--------------|-------|------|-------|------|-------|-----|
| AAA 300% | A (-) | 145% | C (-) | 90% | E (-) | 45% |
| AAA (-) 250% | B (+) | 135% | D (+) | 85% | | |
| AA (+) 225% | В | 128% | D | 78% | | |
| AA 200% | B- | 120% | D (-) | 70% | | |
| AA (-) 185% | C (+) | 110% | E (+) | 65% | | |
| A (+) 165% | | | | | | |

Note: the quality factor ultimately selected should represent a composite judgment of the overall Quality Grade. Generally, the quality of materials and workmanship is fairly consistent throughout the construction of a specific building; however, since this is not always the case, it is frequently necessary to weight the quality of each major component in order to arrive at the proper "overall" Quality Grade. Equal consideration must also be given to any "Additions" which are constructed of materials and workmanship inconsistent with the quality of the main building.

APPLYING THE PROPER COST AND DESIGN FACTOR

Architectural fees, material quantities, labor efficiency, and other factors influencing total construction costs may vary considerably from one building to another, depending upon its particular design. Two dwellings, for instance, showing no marked difference in size and quality may still show a measurable difference in cost, attributable primarily to a difference in design.

In computing the replacement cost of any building, therefore, it is necessary to adjust the cost to account for any features varying significantly from the base specifications from which the pricing schedules were developed.

The pricing schedules included in this manual, unless otherwise specified, have been developed to reflect perimeter-to-area wall ratios of rectangular shaped buildings, uniform eave lines and roof slopes, overhangs, ceiling heights, and other architectural features most typical of conventional designs.

The adjustment for variations in design must be made by applying a Cost and Design Factor denoting a percentage adjustment of the sub-total replacement cost, i.e., apply a +5% to indicate a 5% increase in the replacement cost, apply a +10% to indicate a 10% increase, etc.

The Cost and Design Factors applicable to dwellings will normally range from 85% to 115%. However, the Cost and Design Factors applicable to special architectural designs may range considerably higher. The selection of the proper Cost and Design Factor is largely a product of

the experience and sound judgment of the appraiser, who must have the ability to analyze various construction components and determine the influence of each upon the overall cost.

APPLYING THE PROPER NEIGHBORHOOD MARKET FACTOR

The Neighborhood Market Factor to the dwelling normally ranges from 80% to 130%; but, occasionally a higher or lower ratio may be required. This adjustment becomes necessary after all the adjustments to the cost have been completed accurately, but the value still needs to be adjusted to represent the sales market for an area. The sales information for the area will determine the amount of market adjustment required.

PRICING SCHEDULES AND COST TABLES

The Pricing Schedules and Cost Tables in this manual are provided to assist the appraiser in arriving at accurate and uniform valuations. Used properly, they should prove to be an invaluable tool. Quality valuations, however, are not the product of schedules and tables themselves, but rather of the appraiser's ability to use them effectively. In order to bring this about, a thorough understanding of the make-up and the capabilities and limitations of each schedule is essential. The appraiser must know the specifications, from which the base prices were derived, the composition of the prices, and the proper techniques and procedures for applying the prices. What's more important, the appraiser must be able to exercise good common sense and sound judgment in selecting and using them.

It should also be noted that the schedules and tables in the manual have been developed primarily for mass appraisal and tax equalization purposes. They have, therefore, been designed to provide the appraiser with an uncomplicated, fast, and effective method of arriving at an accurate estimate of replacement costs. In order to maintain simplicity in the schedules, techniques, and procedures, it is often necessary to make certain compromises from a strictly technical and engineering point of view. Extensive effort has been made in developing the schedules to minimize these compromises and limit them to variables that have minimal influence on the final value of the building. The schedules have been designed to reflect actual building costs and practices. Field tests have proven them to be both accurate and reliable and, when applied properly, highly effective in arriving at realistic replacement costs.

GENERAL RESIDENTIAL PRICING SCHEDULES

RESIDENTIAL

QUALITY GRADE OR CLASS

The quality grade of materials and workmanship is the one most significant variable to be considered in estimating the replacement cost of a structure. Two buildings may be built from the same general plan, each offering exactly the same facilities and with the same specific features, but with widely different cost due entirely to the quality of materials and workmanship used in their construction. For instance, the cost of a dwelling constructed of high quality

materials and with the best of workmanship throughout can be more than twice that of one built from the same floor plan but with inferior materials and workmanship prevailing.

The following schedule has been developed to distinguish between variations in cost. This schedule represents the full range of conventional dwelling construction. The basic specifications for each grade, as to type of facilities furnished, is relatively constant; that is, each has a specific type of heating system, two bathrooms, kitchen unit, and other typical living facilities, but with variable quality of materials and workmanship prevailing.

The basic grade represents cost of construction using average quality materials with average workmanship. The majority of dwellings erected fall within one class above and one class below the base grade of C. The layman or professional appraiser can readily distinguish between these classes. The three classes of grade of quality for this group of dwelling have been established as follows:

| Grade B | Good | Quality 128% |
|---------|---------|--------------|
| Grade C | Average | Quality 100% |
| Grade D | Fair | Quality 78% |

In order to justify variation in cost, maintain uniformity and retain complete control throughout the cost range, we have established these base grades. The pricing spread of $20\% \pm$ between each grade is based upon the use of better grade materials and higher quality workmanship from C Grade to B Grade. B Grade dwellings are found to have better individual features and interior finish, which reflects approximately 28% higher costs than C Grade. Likewise, the D Grade dwelling would be constructed of approximately 22% less quality than C Grade, due to the type of materials used and workmanship. Consequently, better quality of construction or construction of cheaper quality can be comparatively observed.

To cover the entire range of dwelling construction, three additional classes of dwellings above the three base grade dwellings must be considered along with one grade dwelling below the base three grades.

The three base grades above are:

| "AAA" | 'Ultimate Quality | 300% |
|-------|--------------------------|------|
| "AA" | Superior Quality | 200% |
| "A" | Excellent Quality | 155% |

The A, AA and AAA Grade dwelling incorporates the best quality of materials and workmanship. Construction costs of AAA Grade dwellings usually run 300% and higher than the cost of C Grade dwellings. The prestige type and the mansion, or country estate-type homes, are usually in this class. The AA Grade dwellings having exceptional architectural style and design are generally the custom built homes and are 200% better in overall construction than the C Grade dwellings. The A Grade dwellings having outstanding architectural style and design are generally the custom built homes and are 55% better in overall construction than the C Grade dwellings.

The dwelling of the cheapest quality construction built of low-grade materials is the E Grade quality.

These seven (7) established base graded or classes of quality will cover the entire range of dwelling construction, from the cheapest to the finest in quality.

USE OF GRADE FACTORS

The grading method is based on C Grade as standards of quality and design. A factor highest grade level to the lowest grade level is established by means of grade factor multipliers. Since not all dwellings are constructed to fall into one of the precise grade levels with no adjustments, it becomes necessary to further refine our grading system. It is not unusual for conventional houses to be built incorporating qualities that fall above or below these established grades. If the house that is being appraised does not fall exactly on a specific grade, but should be classified within that grade, the use of Grade Factor Symbols (+ or -) will accomplish this adjustment in the Grade AAA, AA, A, B, C, D and E Classes.

For a grading increase in the AA Grade category, a plus factor can be used, which will result in each factor being higher than the last.

A Sample Would Be - A dwelling with outstanding architectural style and design, constructed with the finest quality materials and workmanship throughout. Superior quality interior, finish with extensive built-in features. Deluxe heating system and high-grade lighting and plumbing fixtures may be graded A+. The A+ Grade places this house in the Superior Quality range. The + part of the A+ Grade places this house one level above the A Grade category. Grade A+ has a multiplier of 165%. Thus, once you have priced this house to the base level of C, a multiplier of 165% would be applied to adjust the C Grade base level up to the A+ Grade level you desired.

The same approach would apply should you have a house constructed with a very cheap grade of materials, usually culls and seconds, and very poor quality workmanship resulting from unskilled, inexperienced, do-it-yourself type labor. Minimal code, low-grade mechanical features and fixtures may be graded E. The E Grade places this house in the Cheap Quality range. Grade E has a multiplier of 55%. Thus, once you have priced this house to the base level of "E", a multiplier of 55% would be applied to adjust the C Grade base level down to the E Grade level you desired.

NOTE: The quality factor ultimately selected is to represent a composite judgment of the overall Quality Grade. Generally, the quality of materials and workmanship is fairly consistent throughout the construction of a specific building; however, since this is not always the case, it is frequently necessary to weigh the quality of each major component in order to arrive at the proper overall Quality Grade. Equal consideration must also be given to any additions which are constructed of materials and workmanship inconsistent with the quality of the main building.

The appraiser must use extreme caution not to confuse Quality and Condition when establishing grades for older houses in which a deteriorated condition may have a noticeable effect on their

appearance. Grades should be established on original built-in quality as new dwellings, and not be influenced by physical condition. Proper grading must reflect replacement cost of new buildings. Bear in mind a house will always retain its initial grade of construction, regardless of its present deteriorated condition.

AAA Quality Dwellings

These dwellings are constructed of the finest quality materials and workmanship, exhibiting unique and elaborate architecturally styling and treatment, and having all the features typically characteristic of mansion-type homes.

BASE SPECIFICATIONS

FOUNDATION: Brick or reinforced concrete foundation walls on concrete footings with interior piers.

EXTERIOR WALLS: Stone, brick veneer, stucco, log, or frame siding. All exterior walls will be of high quality and constructed with much detail and workmanship. Ample insulation and numerous openings for windows and doors are typical.

ROOF: Slate, tile, cedar shake, or architectural asphalt shingles on quality sheathing with well braced rafters having various slopes and ridges.

INTERIOR FINISH: The interior of these homes is of the highest custom design and construction with much attention given to fine detail and master craftsmanship.

FLOORS: Heavy construction utilizing wood or steel joists and sub floor with the best quality combination of hardwoods, ceramic tile, terrazzo, marble or granite tile, vinyl, or luxurious carpeting.

PLUMBING: A combination of high quality fixtures, high quality materials, and skilled workmanship. Considered typical and adequate for the type of construction, generally exceeding a total of twelve fixtures.

CLIMATE CONTROL: A heating system equal to forced air with ample capacity and insulated ductwork throughout. Air conditioning is included as a part of the specifications.

ELECTICAL: Good quality wiring, maximum electrical outlets and expensive light fixtures.

Grade AAA+

Grade AAA-

AA Quality Dwellings

These homes are architecturally designed and custom built by contractors who specialize in good quality construction. Extensive detail is given to ornamentation with the use of good grade materials and skilled craftsmanship. Homes of this quality are located in affluent areas that will enhance and benefit the home the most.

BASE SPECIFICATIONS

FOUNDATION: Brick or reinforced concrete foundation walls on concrete footings with interior piers.

EXTERIOR WALLS: Stone, brick veneer, stucco, log, or frame siding. All exterior walls will be of high quality and constructed with much detail and workmanship. Ample insulation and numerous openings for windows and doors are typical.

E Quality Dwellings

These homes are constructed of low quality materials and usually designed not to exceed minimal building code. Little detail is given to interior or exterior finish. They are usually built for functional use only. Homes of this type are not specifically located within developments, but may be built as in-fill housing.

BASE SPECIFICATIONS

FOUNDATION: Brick or concrete block foundation walls on concrete footings, piers, or concrete slab.

EXTERIOR WALLS: Stone, brick veneer, stucco, log, frame siding, or concrete block. All walls are cheaply constructed with minimal detail and workmanship. Little or no insulation and minimal windows and doors are typical.

ROOF: Light weight asphalt shingles, roll roofing, or metal on plywood sheathing and frame trusses with minimal slope.

INTERIOR FINISH: The interior of these homes is of fair design and construction with low cost materials. Little attention is given to detail and quality workmanship.

FLOORS: Low cost construction utilizing wood or steel joists and sub floor with some hardwoods, vinyl, and/or low quality carpeting.

PLUMBING: A combination of fair quality fixtures, typical quality materials, and workmanship. Considered adequate for the type of construction. Generally, the dwelling does not have more than a total of five fixtures.

CLIMATE CONTROL: A heating system equal to forced air with minimal capacity and ductwork throughout. Air conditioning is part of the specifications.

ELECTICAL: Minimal quality wiring, limited electrical outlets and inexpensive lighting.

Grade E+

Grade E

MANUFACTURED HOUSING

General

Manufactured housing can be single-wide manufactured homes, double-wide manufactured homes, multi-sectional homes, or modular homes. Non-modular structures are designed with a steel undercarriage and wheel assemblies for transporting to the site: Note most modular homes have wood joist rather than a steel undercarriage. For mass appraisal purposes, both wood joist and steel undercarriage homes that are classified as modular are considered to be like stick-built homes.

As of June 15, 1976, all manufactured homes built, after that time, must meet or exceed Federal Standards outlined in Title VI, Housing and Community Development Act of 1974. These standards (building codes) are administered by United States Department of Housing and Urban Development (HUD). The HUD code, unlike conventional building codes, requires manufactured homes to be constructed on permanent chassis. Manufactured homes that are not consider modular homes must have a red/silver certification (HUD certification) on the exterior of each transportable section when transported from the factory.

Modular homes are constructed on the same state, local and regional building codes (conventional building codes) as site built homes which exceed the HUD code and have a "State of North Carolina Modular Construction Validating Stamp" on the interior of the home. For mass appraisal purposes all factory constructed homes are to be classified as either manufactured (single-wide, double-wide, etc.) or modular.

MODULAR HOME CLASSIFICATION STANDARDS

All homes constructed in a factory may be considered a manufactured home, but only those that meet or exceed the North Carolina State Residential Building Code may be considered modular homes. North Carolina General Statute 105-164.3(21b) defines modular home as "a factory-built structure that is designed to be used as a dwelling, is manufactured in accordance with the specifications for modular homes under the North Carolina State Residential Building Code (NCSRBC), and bears a seal or label issued by the Department of Insurance pursuant to G.S. 143-139.1". Also, in addition to NCSRBC, modular homes may be required to be constructed to local and/or regional building codes. North Carolina addresses the construction and definition of modular homes under the North Carolina State Building Code Volume VIII – Modular Construction Regulations. The quality of modular homes is considered to be the same as site built homes per memorandum from the North Carolina Department of Insurance (see memorandum, page 383). For mass appraisal purposes structures that are considered modular must meet current general statute requirements. Note: All homes classified as modular will be considered as real property, even if on someone else's land.

MANUFACTURED HOME CLASSIFICATION STANDARDS

All manufactured homes not meeting the requirements of a modular home are to be considered using the term "manufactured home" for mass appraisal purposes. N.C.G.S. 105-273(13), in

defining real property, provides for the inclusion of manufactured homes. Also, N.C.G.S. 105-316.7 defines mobile home and manufactured home.

Any manufactured home will be considered *real property* and will be valued in accordance with the schedule of values if the owner of the land and the owner of the home placed upon the land are the same, having the towing hitch and axle assembly removed and placed upon a permanent foundation as required by the Gaston County Building Department; also, any manufactured home on land leased for twenty (20) years or more or on a land/home purchase contract.

If the owner of the manufactured home does not own the land it occupies, the home will be considered a *personal property* item. If the manufactured home is considered a *personal* item, it will be noted within the miscellaneous items section of the property record card.

RESIDENTIAL COST SCHEDULES

The Cost Approach to value lends itself best to property valuation for tax purposes for two principal reasons.

- 1) Appraisals for Ad Valorem purposes require separate land value estimates.
- 2) The Cost Approach can be applied to all classes of property.

The use of one approach to the exclusion of others is contrary to the appraisal process. The approach outlined in this manual includes cost schedules which have been developed and are supported through analysis and incorporation of economic factors indicated by all three approaches to value: Cost, Income and Market.

The following cost schedules are based on a model residence constructed using typical components, average quality workmanship and materials, consisting of fifteen hundred (1500) square feet, two full baths, kitchen sink and hot water tank, central heating and air conditioning system, crawl space, gable roof with asphalt shingles and site improvements.

The general pricing procedure is as follows:

Main area type- Determine the type of residential structure. Multiply the total square footage of the first and upper floors by the main area price per square foot and by the size factor and story adjustment. If there is a cost or design factor it would be multiplied to the total.

Adjustments to the main area are calculated from the norm of the base structure. (Note: when referring to square footage of main area, this is the first and upper floor area and does not include finished area in basement.)

Heat type- the standard is central heat and air conditioning. Determine the heat type for the structure and multiply the total square footage by the heat type rate by the size adjustment for the total square footage of the main area.

Foundation type- the standard is crawl space. Determine the foundation type and multiply the 1st floor square footage by the foundation type rate by the size adjustment for the total square footage of the main area.

Exterior wall material- add for brick/stone or masonry frame. Determine the exterior wall type and multiply the total square footage of the main area by the exterior wall rate and by the size adjustment for the total square footage of the main area.

Plumbing type- the standard is 2 baths, 0 half bath, 1kitchen sink, 1 hot water tank. A full bath is 3 fixtures only; any additional fixtures add in addition fixtures. Half bath is two fixtures. Determine the number of full baths, for each full bath above or below 2 adjust by \$4,500. Determine the number of half baths. Multiply the number of half baths by \$3,000. Determine the number of extra fixtures and multiply by \$1,500 per fixture. There is no size adjustment applied. Add the total adjustment from full baths, half baths, and extra fixtures to get total plumbing adjustment.

Fireplace type- the standard is no fireplace. Determine the type of fireplace. Multiply the fireplace type rate by the number of fireplaces. No size adjustment applied.

Basement type the standard is no basement. Determine the type of basement. Multiply the square footage of the basement type by the basement type rate by the size adjustment for the total main area. If the basement has a garage, take the basement garage door rate by the number of cars capacity.

Interior Finish- the standard is average for quality. Multiply the total square feet of the main area by the interior finish type rate by the main area square foot size adjustment.

Elevator type- the standard is no elevator. Determine the type of elevator. Multiply the elevator rate times the number of elevators. No size adjustment is applied.

Roof type- the standard is gable style. Determine the roof type and multiply the 1st floor square footage by the Roof type code rate by the main area square foot size adjustment. See page 349 for roof type pictures.

Roof cover- the standard is asphalt shingles. Determine the roof type and multiply the 1st floor square footage by the roof cover type rate by the main area size adjustment for the total main area.

Additions to the main area- select the addition type for each addition to the main area. Multiply the rate of the addition type by the square foot of the addition by the size adjustment for that addition type.

Final calculations - sub-total the main area, adjustment to the main area and additions to the main area. Apply the proper Quality Grade Factor to arrive at the Replacement Cost New.

Listed below is all main area, adjustments to main area, additions to main area and quality grade factor for pricing explanation above.

Main Area

| R1 | Residential Single Family | \$ 143.00 |
|----|---------------------------|--------------|
| R2 | Multi Family Home | \$ 138.00 |
| R3 | Modular Home | \$ 138.00 |

| R4 | Multi Sect Manufactured | \$ 88.00 |
|----|--------------------------|-------------|
| R5 | Single Sect Manufactured | \$ 58.00 |

COMMERCIAL/INDUSTRIAL SCHEDULES

Commercial and Industrial pricing schedules are provided for a variety of buildings based on the use of the buildings. Commercial/Industrial Schedules are to be used as a guide for computing the replacement cost new of Commercial / Industrial / Apartments / Exempt buildings.

The general application of all the schedules is essentially the same; select the base price (per square foot) which is most representative of the subject building and adjust the base price to account for any significant variations.

SCHEDULE FORMAT - BASE PRICES

The schedules designate base prices by use type for a series of perimeter-area ratios and wall types. "CC" Grade base prices are provided for various finish types at different floor levels with specified floor-to-floor heights.

The base price is determined by selecting the appropriate square foot price based on the use and floor level. The base price is adjusted by construction type and is adjusted for variations in wall height, and area perimeter ratio adjustments.

The base prices for each use type includes: the exterior walls with normal openings, interior finish, mechanical features, partitions, plumbing, lighting, and other basic features typical for that particular use.

Base prices also include: normal footings and foundation construction for a building at grade level, normal parapets and coping, ground floor slab including base and cement finish, normal roof construction consisting of insulation, decking, framing, and utility service.

Lower level include excavation and backfill and structural floor (for first floor) construction consisting of sub floor and framing.

CONSTRUCTION TYPES

- Wood Frame/Joist/Beam to indicate construction, which incorporates wood, stud balloon or platform framing or wood post and beam framing (mill construction). This category also includes masonry structures, which incorporate wood joist or plank floor systems, or wood joist, truss, or rafter roof systems.
- **Fire Resistant** to indicate buildings with exposed structural steel, or reinforced concrete columns and beams. Multi-story structures will have steel floor joists with concrete plank or a reinforced concrete floor system. Exterior walls will typically be masonry or metal and glass panels.
- **Fireproof** to indicate typically high rise buildings with fabricated, heavy, structural steel column and beam framing which has been enveloped in a fire-proof material such as concrete or gypsum. Floors will be reinforced concrete or pre-cast concrete plank on steel joists protected by a gypsum-vermiculite plaster on metal lath ceiling. Exterior walls will be masonry or metal and glass panels.
- **Pre-Engineered Steel** to indicate buildings framed with prefabricated steel members. The structure will incorporate metal beams, girders columns and purloins, or light gauge steel joists manufactured from cold-formed shapes of sheet or strip steel. Multi-story buildings may have floors of wood, steel, or concrete. Exterior walls will typically be pre-finished metal siding or sandwich panels.

QUALITY GRADE SPECIFICATIONS

The base prices are for normal "C" Grade buildings erected with average quality materials and workmanship. A Table of Quality Factors is provided to adjust the "CC" Grade prices in order to account for variations in construction quality.

CAAA Grade Buildings generally having an elaborate architectural style and design, constructed with the excellent quality materials and workmanship, excellent quality interior finish, built-in features, heating and cooling systems, and very good grade plumbing and lighting fixtures.

CAA Grade Buildings generally having an outstanding architectural style and design, constructed with the finest quality materials and workmanship, excellent quality interior finish, built-in features, heating and cooling systems, and very good grade plumbing and lighting fixtures.

CA Grade Architecturally attractive buildings constructed with very good quality materials and workmanship, high quality interior finish, built-in features,

heating and cooling systems, and very good grade plumbing and lighting fixtures.

CB Grade Buildings constructed with good quality materials and above average

workmanship, moderate architectural treatment, good quality interior finish, built-in features, heating and cooling, plumbing, and lighting

fixtures.

CC Grade Buildings constructed with average quality materials and workmanship

that conform to the base specifications used to develop the pricing schedule. Average architectural treatment, average quality interior finish and built-in features, standard quality heating and cooling systems,

plumbing, and lighting fixtures.

CD Grade Buildings constructed with economy quality materials and fair quality

workmanship, void of architectural treatment, with fair quality interior finish and built-in features, low grade heating and cooling, plumbing, and

lighting fixtures.

CE Grade Buildings constructed with a very cheap grade of materials, usually

"seconds", and very poor quality workmanship resulting from unskilled, inexperienced, "do-it-yourself" type labor. Contains low grade heating

and cooling, plumbing, and lighting fixtures.

Note: The quality factor selected is to represent a composite judgment of the overall grade. Generally, the quality of materials and workmanship is consistent throughout the construction of a specific building. However, since this is not always the case, it is necessary to weigh the quality of each major component in order to arrive at the proper "overall" quality grade. Particular consideration must be given to "special features", such as elevators and banking features, since variations for quality are already considered in the respective pricing tables. Equal consideration must also be given to those "additions" which are constructed of materials and workmanship inconsistent with the quality of the main building.

FRANCHISE FOOD RESTAURANTS

Franchise Food restaurants have become common place beginning in the 1950's. The buildings, though they offer similar accommodations, are highly distinctive in architectural style and design. Each operation is readily identifiable with a particular design and motif and relies heavily on the appearance or "eye appeal" of its buildings to attract, maintain and promote business. The wide range of styles and designs has a direct influence on the replacement costs of the buildings. The size and quality of materials and workmanship alone are not the prime determining factors. Two restaurants showing no marked difference in size and construction quality may still show a considerable difference in cost due to the difference in design and décor. The replacement cost schedule provided is based upon specifications of size, quality, and design. The schedule is to be used as a guide for estimating replacement costs of franchise food restaurants. The proper use of the schedule, along with experience and sound judgment, should enable the appraiser to establish a reasonable estimate of replacement cost.

QUALITY GRADE SPECIFICATIONS

CAA and CA Grade

A unique design featuring elaborate architecture, especially in the roof and exterior walls, built of high quality materials and workmanship. A-Frame, Mansard, Gambrel, or Multi-Pitch type roofs with extensive overhangs, and copper, porcelain enamel shingles, wood shakes, slate, or comparable high quality roofing on insulated wood or steel decking and framing, with laminated wood frame or steel frame supporting beams and columns often exposed to project architectural effects. Walls consist of a combination of face brick or ceramic glazed brick, decorative stone or wood and plate glass. High quality interior finish of ceramic or quarry tile flooring, exposed stone and brick or high grade wood or porcelain enamel paneling and ceramic tile wall finish. Porcelain enamel or acoustical tile ceilings, often open to the roof slope; combined heating and air conditioning system; high grade ornamental lighting fixtures in the dining and service areas; good quality plumbing fixtures for typical toilet room facilities.

CB Grade

Conventional design featuring custom architectural styling, built of good quality materials and workmanship. Mansard, Gambrel or Double-Pitch roofs with liberal overhangs, composition tar and gravel, stone chip, or asphalt shingle roofing on insulated wood or steel decking and framing; face brick, ceramic tile and plate glass exterior walls with moderate architectural treatment; good quality interior finish of ceramic or quarry tile flooring, exposed brick or wood paneling and ceramic wall finish; acoustical tile or drywall ceiling; combined heating and air conditioning system, ornamental lighting fixtures in the dining and serving areas, and good quality plumbing fixtures for typical toilet room facilities.

CC Grade

Conventional design featuring moderate architectural styling, built of good quality workmanship and materials. Double-Pitch type roofs with normal overhangs, composition tar and gravel or asphalt shingle roofing on insulated wood or steel decking and framing; face brick, wood, or painted concrete block and plate glass exterior walls; good quality interior finish of quarry or vinyl asbestos tile flooring, wood paneling or drywall and part ceramic tile wall finish; drywall or acoustical tile ceiling; combined heating and air conditioning system; fluorescent lighting fixtures in the dining area, and good quality plumbing fixtures for typical toilet room facilities.

CD Grade

A simple conventional design void of architectural styling, built of average quality materials and workmanship. Flat or Single Pitch roof with normal overhangs, composition roofing on insulated wood decking and framing; painted concrete block or wood exterior walls with a minimal amount of plate glass; average quality interior finish consisting of asphalt or vinyl asbestos tile flooring; painted concrete block, drywall or paneled wall finish and drywall ceiling; forced-air heating; wall unit air conditioning; fluorescent lighting fixtures; fair quality plumbing fixtures for typical toilet room facilities.

CE Grade

Simple design void of architectural styling, built of fair quality materials and workmanship. Single-Pitch roof with normal overhangs, and composition roofing on wood decking and framing; painted concrete block or wood exterior walls with a minimal amount of plate glass; low quality interior finish consisting of asphalt tile flooring and painted concrete block and drywall; unit heaters; no air conditioning; fluorescent lighting fixtures; and fair quality plumbing fixtures for typical toilet room facilities.

GENERAL APPLICATION

The schedules can be effectively applied to either a total building or a section of the building. The general pricing procedure is as follows:

Main Area- There could be multiple sections and a base rate for the lower level, first floor and upper floors of each building. Each section and floor could have a different base rate depending on the use of the floor and section. Select the main area type that best describes the use of the building, section, or floor. Each use type will point to a perimeter adjustment table and the height adjustment table.

For each floor of each section of a building multiply the square footage by the base rate of the use type selected and then by the perimeter and height adjustment. Add the total of all floors for each section and multiply by the construction factor, cost, and design factor.

Adjustments to the main area are calculated below.

Heat type- the standard is no heat or air. Determine the percentage of each heat and air conditioning type for the finished total square footage of each section of the building. Multiply the square footage of each type of heat and air condition by the rate by the perimeter adjustment. (Example: 3story building with central heat and air and the base floor is 1000 square feet. It would be listed as 300% of the base floor area or 3000 square feet. The 3000 square feet would be multiplied by the rate.)

Exterior wall material- the standard is wood or equal. Add or subtract for the different types of wall material. There will be no wall adjustment for lower level. Multiply the percent of the square footage of the first and upper floors by the rate of the exterior wall type and then by perimeter adjustment.

Sprinkler System- the standard is no sprinkler system. Determine the percentage of each sprinkler system for the total square footage of each section of the building. Multiply the square footage of the type of sprinkler system selected by the rate and by perimeter adjustment.

Elevator/Escalator- the standard is no elevators or escalators. Determine the type of elevator, how many stops, escalators, and lifts. Multiply the number of units or stops by the rate.

Fireplace- the standard is no fireplace. Determine the type of fireplace or stack. Multiply the number of units by the rate.

Solar Panel- the standard is no solar panels (no value attributed to solar panels). Determine the number of solar panels.

Additions to the main area- select the addition type for each addition to the main area. Multiply the rate of the addition type by the square foot of the addition by the size adjustment for that addition type.

Final calculations - sub-total the main area, adjustment to the main area and additions to the main area for each section. Apply the proper Quality Grade Factor to arrive at the replacement cost new for that section.

Main Area Types

| MAIN AREA | DESCRIPTION | LOWER LEVEL | FIRST FLOOR | UPPER FLOOR | PERIMETER | WALL HT |

OTHER BUILDING AND YARD ITEMS PRICING SCHEDULES

The Other Building and Yard Item pricing schedules are provided to calculate the replacement cost new of a variety of types of structures typically associated with residential and commercial property.

Residential

Base prices and adjustments are provided for swimming pools, detached garages, greenhouses, carports, canopies, utility buildings, tennis courts, boat houses, and boat docks. Each structure has been assigned a unique Structure Type Code to be utilized on Computer-Assisted Mass Appraisal (CAMA) programs.

RC2
CANOPY

RC1
CARPORT

RG1 FRAME GARAGE

RS1 FRAME SHED

RP1 SWIMMING POOL

RC3
METAL
CAR SHED

RC4
METAL
ENCLOSED
CAR SHED

RG5 BRICK GARAGE W/ATTIC

The general pricing procedure is as follows:

Determine the Miscellaneous Structure code that best describes the structure. (Ex. detached frame garage is a RG1) Multiply the square footage of the building by the square foot rate or quantity by the quantity rate times the size factor for that structure code. Apply the proper Quality Grade Factor to arrive at the Replacement Cost New.

The following table shows the cost, size adjustment and depreciation table for each structure

| | | | Size | Dep. |
|---------|--------------------------|-------------|------|-------|
| MS Code | Description | Rate | Adj. | Table |
| RA1 | Open Porch | \$41.55 | MS5 | D3 |

The following information is added to help in the understanding of golf course and manufactured home park cost valuation.

GOLF COURSES

Golf courses are designed and built in a variety of types and sizes. The pricing schedules in this section are provided as a guide to assist the appraiser in arriving at a reasonable and equitable estimate of the cost of developing the various types of courses.

REGULATION COURSES

A regulation golf course usually consists of 18 holes of varied length. There are generally four short holes, 130 to 200 yards (par 3); ten average holes 350 to 400 yards (par 4); and four long

Gaston County 2023

holes 450 to 550 yards (par 5). Average costs per hole are given for five grades of courses; the general specifications are as follows:

Excellent

Excellent- course designed for professional play; rolling terrain; well landscaped with wide tree lined fairways and large, excellent quality greens and tees; numerous natural and man-made hazards; generally, 7200 yards long with a par 72 rating.

Very Good

Very good- course design for championship play; rolling terrain; well landscaped with wide fairways and large, very good quality greens and tees; many natural and man-made hazards; generally, 6900 yards long with a par 72 rating.

Good

Good- course design for private club membership; rolling terrain; well landscaped with wide fairways and large good quality greens and tees; natural and some man-made hazards; generally, 6500 yards long with a par 70 rating.

Average

Average- course designed for municipal or general public play; flat terrain; landscaped fairways; average size and quality greens and tees; some natural and few, if any, man-made hazards; generally, 6000 yards long with a par 67 to 70 rating.

Fair

Fair- Simply developed course often referred to as a "cow-pasture course"; flat terrain; very little landscaping; small greens and tees; few natural hazards; generally, 5400 yards long with a par 64 to 67 rating.

BASE PRICE COMPONENTS

The costs per hole have been developed to include the cost of normal on course improvements and do not include the cost of land, clubhouse, or any recreational facilities. The base price components are as follows:

Grading and Clearing. . . includes the removal of brush and trees from the fairways, greens, or tees; landscaping and the seeding of grass.

Sprinkler System. . . includes the water source, pumps, piping, and sprinkler heads.

Greens. . . includes the building, seeding and care of the greens until the opening of the course. Tees. . . includes the building and care of the tees until the opening of the course.

Bunkers... includes the building and care of the bunkers until the opening of the course.

Service and Cart Roads. . . includes base preparation, paving, and bridges over hazards.

Architect's Fees. . . includes all plans and supervision during construction.

OTHER COURSES

Miniature Course The entire course is comprised of a putting surface which has

various obstacles and hazards placed between the tee and the cup.

Pitch and The course has greens, bunkers, tees, fairways, and very Putt Course little, if any, rough area separating the holes. The holes are

usually 60 to 120 yards long and the course often has lighting for

night play.

Par 3 Course The course is the same as a regulation course, but on a smaller

scale with all the holes rated par 3, 140 to 160 yards long and the

course may have lighting for night play.

Executive Course Also called a par 60 course; the course is the same as a regulation

course, but on a smaller scale with the holes 200 to 300 yards long. The holes are mostly par 3 with some par 4 and par 5

ratings.

Driving Range Consists of a piece of land, usually 10 to 15 acres, with elevated

tees along one side used for practice of hitting tee shots on

regulation courses.

Practice Consists of a large green with numerous cups used for

Putting Greens putting practice.

GENERAL APPLICATION

The primary variables in golf courses are size, layout, sprinkler system, greens, tees, fairways, and bunkers. Costs of courses may vary from \$30,000 per hole for a course with minimal improvements to \$300,000 per hole for the best championship courses. The costs given are for average courses in each quality grade. Included in the cost per hole are normal clearing and grading, complete sprinkler systems, landscaping, greens, tees, bunkers, service and cart roads, and architect's fees. Costs do not include buildings, swimming pools, parking areas, or any other off-course improvements. Listed below is the procedure to be used for the appraisal of golf courses.

- 1. Identify the course by name.
 - a. The type of course (regulation size, pitch and putt, miniature, etc.).
 - b. The year of completion (if developed in phases, describe the number of holes completed each year).
 - c. The number of holes and the amount of land used for the course.
 - d. The course length and par.
 - e. The terrain and topographical features.
 - f. The average size of the greens, tees, and the number of bunkers.
 - g. The type of sprinkler system.

- 2. Analyze the various components of the subject property, giving special consideration to . . . the extent of planning. . . . the natural contour of the land. . . clearing and grading of fairways, greens, and tees. . . the extent and quality of the sprinkler system: whether it is automatic, manual, covers the entire course, or only the tees and greens. . . the average green and tee size. . . the average number of bunkers per hole. . . the quality of cart and service roads. . . any other characteristics essential to establishing the proper grade level of the course.
- 3. Determine the Quality of the course by comparing its components, as analyzed above, with the given specifications for each grade and select the corresponding base cost per hole.
- 4. Multiply the replacement cost per hole based on the quality, as derived in Step #3, by the total number of holes to arrive at the total replacement cost of the course.
- 5. Determine the proper depreciation allowance based upon the condition, desirability, and usefulness of the course relative to its age, and apply it to the total replacement cost as derived in Step #4, to arrive at the depreciated value of the course.
- 6. Sketch, list, and compute by using the appropriate pricing schedule, the replacement cost and depreciated value of all improvements not included in the base cost.

 See pricing example below.

GOLF COURSE PRICING EXAMPLE

Wiley Point Golf Course - an 18 hole regulation size course, 6500 yards long, par 72, located on 150 acres of rolling terrain. The course is 10 years old and has 10000 square foot greens, (3) 2500 square foot tee locations for each hole, and (3) bunkers per hole. Fairways and greens have automatic sprinkler system.

This course is judged to be a Good Quality Course with very good greens and tees, good overall condition, desirability and utility. Land value is estimated at \$5000 per acre

| Base Cost Per Hole Good Quality | \$ 100,000 |
|------------------------------------|-------------|
| Good Quality Factor | 128% |
| Replacement Cost Per Hole | \$ 128,000 |
| Number of Holes | X 18 |
| Total Replacement Cost | \$2,304,000 |
| Less Depreciation -20% | - 460,800 |
| Total Value of Course Improvements | \$1,843,200 |
| Land Value (150 acres @ \$5000) | \$ 750,000 |
| Total Value | \$2,593,200 |
| Value Per Hole (Rounded) | \$ 144,100 |

GOLF COURSE PRICING

EXCELLENT QUALITY

Professional Course: 18 holes located on 160 to 250 acres, 6900 to 7200 yards long, rated par 72, rolling terrain. Costs include: automatic sprinkler system on greens and fairways; greens are 8000 square foot or above top quality construction with drainage tile; tees are 2100 square feet or above with 5 tee locations; 3 to 8 bunkers per hole; good quality cart paths.

VERY GOOD QUALITY

Championship Course: 18 holes located on 160 to 200 acres, 6900 to 7000 yards long, rated par 72, rolling terrain. Costs include: automatic sprinkler system on greens and fairways; greens are 8000 to 10000 square foot top quality construction with drainage tile; tees are 2100 to 2400 square feet with 3 tee locations; 3 to 4 bunkers per hole; good quality cart paths.

GOOD QUALITY

Private Club Course: 18 hole located on 130 to 175 acres, 6500 to 6900 yards long, rated par 70 to 72, rolling terrain. Costs include: automatic sprinkler system on greens and fairways; greens are 5000 to 8000 square foot good quality construction with drainage tile; tees are 1800 to 2100 square feet with 2 to 3 locations; 2 to 3 bunkers per hole; good quality cart paths.

AVERAGE QUALITY

Public or Semi-Private Course: 18 holes located on 100 to 125 acres, 5500 to 6500 yards long, rated par 68 to 72, gently rolling or flat terrain. Costs include: automatic sprinkler system on greens, manual system on fairways; greens are 3000 to 5000 square foot average quality with minimal drainage tile; tees are 1500 to 1800 square feet with 2 locations; 2 bunkers per hole; average quality cart paths.

FAIR OUALITY

Public Course: 9 to 18 holes located on 75 to 100 acres, up to 5400 yards long, rated par 34 to 70, flat terrain; automatic or manual sprinkler system on greens; manual on fairways; greens are 2000 to 3000 square feet with 1 or 2 locations; average of 1 or less bunkers per hole; fair quality cart paths.

PAR 3

Non-regulation golf course, consisting of 9 to 18 holes located on 25 to 50 acres, 1800 to 2500 yards long, par 27 to 54, flat or gently rolling terrain; manual sprinkler system on greens and fairways; greens are 1000 to 1500 square foot fair quality construction with natural drainage; tees are 500 to 1000 square feet with 1 location; minimal number of bunkers; no car

MOBILE HOME PARKS

The pricing schedule included in this section is provided as a guide to assist the appraiser in arriving at a reasonable and equitable estimate of the cost of developing a variety of commercial mobile home and trailer parks. Typical site-costs are given for five Grades of parks; the general specifications are as follows:

CB Grade

Gaston County 2023

CA Grade Excellent quality and excellently planned mobile home parks, designed to accommodate the largest tractor-drawn or on-site erected mobile homes, and to provide the user with the utmost in residential amenities, including spacious lots with extensive and attractive landscaping, ample off-street

parking, and a wide variety of recreational facilities. Site areas will generally range from 4,500 to 5,500 sq. ft.

Good quality and well planned mobile home parks, designed to

accommodate the larger tractor-drawn mobile homes with room to spare for lawns and gardens, and featuring attractive landscaping, off-street parking, and complete recreational facilities. Site areas will generally

range from 3,500 to 4,500 sq. ft.

CC Grade Average quality and well planned mobile home parks, designed to

accommodate mobile homes up to 55' to 60' long, and to provide the user with adequate utility services and facilities, but rather limited recreational facilities and other such amenities. Site areas will generally range from

2,500 to 3,500 sq. ft.

CD Grade Fair quality and minimally planned trailer parks, intended primarily for

semi-permanent occupancy, built to accommodate car-drawn trailers up to 40' to 45' long and offering only minimal utility and recreational

facilities. Site areas will generally range from 1,750 to 2,500 sq. ft.

CE Grade Cheap quality trailer parks, designed to accommodate transient type

trailers, and to provide the user with the minimum required facilities. Site

areas will generally range from 1,000 to 1,750 sq. ft.

Application of the pricing schedule involves determining the Grade, which is the most representative of the subject property, selecting the corresponding base site-cost, and adjusting the base site-cost to account for any variations between the subject property and the model specifications.

BASE COST COMPONENTS

The costs per site have been developed to include the cost of normal basic on-site improvements and do not include the cost of the land, service and recreational buildings, or major recreational structures, such as swimming pools. The base components are as follows:

Engineering. . . includes the design plans and specifications of the park (exclusive of buildings), engineering and surveying fees, and public fees and permits.

Grading. . . includes the normal grading involved in leveling the site for drainage and roughing out roads, but does not include any abnormal site preparation, such as the excavation and terracing required for hill-side sites.

Street Paving. . . includes base preparation and paving.

Patios and Walks. . . includes all flat work other than street paving.

Sewer. . . includes all on-site lines, but does not include hook up charges, sewage disposal systems, or any off-site connections to trunk lines.

Water. . includes on-site mains and site services, but does not include wells, pumps, or any off-site connections to source lines.

Electrical. . includes on-site conduit, electrical and telephone wiring, site outlets, and street and common area lighting commensurate with the grade but does not include the cost of any off-site connections.

Gas. . . includes on-site piping, and site and building connections, but does not include any off-site mains.

Other Features. . . include the cost of average entrance ornamentation, landscaping, and common area development commensurate with the park Grade.

(Note: Outdoor recreational facilities, such as swimming pools, tennis courts, etc. are not included and should be computed separately.)

BASE COST ADJUSTMENTS

Many mobile homes and trailer parks are apt to possess some features which are typical of one Grade and some features which are typical of another. For example, an A Grade park may exhibit B Grade "other features" such as entrance decor, landscaping, and recreational facilities; or, similarly, a park may be C Grade in all respects except for good quality streets. In such cases, the appraiser must analyze each park in terms of its individual component in order to determine the contribution of each component to the overall cost per site. In order to facilitate this, the specifications and corresponding costs for each component are detailed, thus enabling the appraiser to adjust the base cost either upward or downward to account for any significant variations.

MOBILE HOME PARKS

The average quality mobile home park is designed to provide the user with adequate utility services and facilities. Recreational amenities are limited or nonexistent with streets and landscaping of minimal planning and construction.

Normal on site improvements include: low cost concrete or asphalt pads and walks, and enough grading to allow adequate site preparation, drainage, and leveling; minimal on site electrical service; on site well and septic service; on site public or private water and sewer systems.

The value attributed to land, and the cost of any supportive structures, are not included in the base cost site.

Any variation in overall quality from average should be reflected by the appropriate quality grade adjustment.

DEPRECIATION SCHEDULES AND TABLES

It is often advisable to develop schedules and tables to be used as a guide for the appraiser to determine value. The use of such tables is especially applicable in mass appraisals for tax equalization purposes where it is essential to establish and maintain uniformity. Depreciation tables, however, based on actual age alone are impractical. Remodeling, for instance, has the effect of prolonging the remaining life of a building, thus making its effective age considerably different than its actual age. Consideration must be given to all the factors operating to influence the overall physical condition, functional, and economic uses of the property.

RESIDENTIAL DEPRECIATION

As houses grow older, they wear out; they become less desirable, less useful. This universal decline in value is called depreciation, and appraisers are required to determine the degree of this loss in each property they examine. If all houses deteriorated at the same rate, this decline in

value would be a simple function of the age of the structure - a certain percentage per year. However, houses depreciate at varying rates depending on a number of variables.

Every building is acted upon by two value reducing forces. One tends to shorten its physical life; the other shortens its economic life. Both forces act concurrently, overlap, and affect each other. A new house, or any type of structure for that matter, has its greatest value at the moment of completion. Its expectancy of life - both physical and economic - is longest on the day the key is handed over by the builder. The building is then most desirable and most useful. The future benefits which the occupant may expect to enjoy are at the maximum. From that day forward, however, decay and wear and tear act to lessen the value of the structure by curtailing its remaining capacity for use.

At the same time the house is "wearing out ", it is also "going out of style". It is becoming less desirable. It is progressively becoming less useful, both from the effect of forces within the property (obsolescence), and outside of it as well (encroachment of undesirable influences such as less desirable property uses).

Neither physical decline nor functional loss is constant in their action. Deterioration is a relatively steady process offset periodically by maintenance. Worn-out elements of the building are repaired or replaced at intervals, depending upon the policy of the owner. Cheaper houses generally deteriorate faster than better ones. Obsolescence and encroachment may come slowly, or happen almost overnight. The forces which cause both deterioration and functional/economic depreciation may act, and often do act simultaneously, but they are not necessarily related. A house may decline in physical condition and yet, throughout its entire life, remain relatively functional.

Obviously enough, the age of a house remains an important factor in estimating accrued depreciation. A certain number of houses will receive "normal" maintenance and will experience "average" economic loss due to obsolescence and functional depreciation. These buildings will depreciate at an average rate as they grow older.

Other houses will lose value at lesser or more rapid rates. Condition Ratings provide a logical reasoning process, by means of which normal age depreciation may be modified according to the appraiser's best determination of the relative loss, of value in a structure, as compared with the average loss that might be expected. Thus, the age of a dwelling is an unreliable indicator of the degree of depreciation from its cost new. Houses depreciate not merely because they grow older - but because they wear out and become less desirable and less useful from a variety of causes.

To assist the appraiser in establishing the "Condition Ratings" of buildings, several simple classifications have been established. These classifications or ratings are entirely natural, and will fit the normal impressions of the appraiser as he examines a building. Following is a tabulation of Condition Ratings, with their accompanying definitions of the observed physical condition of the building, and its degree of desirability and usefulness for its age and for its type.

CONDITION RATING GUIDE

Condition Rating DEFINITION

Of Dwelling

Rehabbed Older building gutted and a total remodel.

Excellent Building is in perfect condition.

Very Good Slight evidence of deterioration.

Good Minor deterioration visible.

Average Normal wear and tear is apparent.

Fair Marked deterioration - but quite usable.

Poor Definite deterioration is obvious; and barely usable.

Very Poor Condition approaches unsoundness; and almost unusable.

Unsound Building is definitely unsound and unfit for use.

Age is reflected as an index of the normal deterioration and obsolescence in a structure which may be expected over the years. Physical condition represents a variable measure of the effects of maintenance and remodeling on a building.

Depreciation is defined as the resultant estimate of the diminishing value of an improvement, after subtracting the amount of estimated depreciation from the Replacement Cost New. Rating of a building has been established through a consideration of its physical condition for its age, reference to the Basic Depreciation Table will indicate the appropriate value percent to be reduced for a structure possessing these qualities in the degree observed and noted by the appraiser.

The degree of deterioration and obsolescence, or loss of value from all causes, both within and without the property, is taken into account. This is accomplished by means of adjusting for physical, function and economic by rating the capabilities and qualities of the structure in precisely the same terms as would a prospective purchaser. Sound valuation theory presupposes the existence of a prospective buyer with intelligence enough to compare the advantages and disadvantages of competing properties, and to rate the property he is examining according to its relative degree of desirability and usefulness.

APPLYING THE DEPRECIATION SYSTEM

To apply the System, the appraiser rates each house according to his composite impression of its relative physical condition for its age and type. The following four actual cases illustrate this convenient and practical method of determining physical depreciation in houses.

Case One: A fifteen-year-old single family residence, situated in an attractive residential suburb of a typical American community. Grade "B" with two baths and minor deterioration is visible: slightly less attractive and desirable than new, but useful. A qualified observer would rate this

house average to fair on the physical depreciation table. Accordingly, our appraiser would apply a market factor to indicate the location in a good neighborhood. Referring to the table, we find 20 to 25 percent depreciation would be appropriate.

Case Two: A one story frame house, seven years old. Grade "C" or average quality construction with three bedrooms and one and one-half baths structure shows normal wear and tear and has average attractiveness. The appraiser's impression is, "for a seven-year-old Grade "C" house, this would be rated as Average." From the table we find 12% depreciation is indicated.

Case Three: This century-old Colonial style frame house is located in a New England seaport community, erected 1858. Grade "B" or good quality construction and the building has been extremely well maintained and completely modernized with central heating, electric lighting, and plumbing added. The structure is in very good physical condition in spite of its age. Building is architecturally attractive and quite desirable. The appraiser's impression is, "for a very old house of Grade "B" quality, this house would be very good condition. From the depreciation table 35% is indicated.

Case Four: A twenty-four-year-old single family residence of Grade "C" quality; one story and basement, frame construction, and three bedrooms with a bath. Structure has had normal maintenance and is average in physical condition. Within the past two years, an elevated six-lane expressway, passing over the adjoining lot, has been erected. This encroachment has seriously detracted from the attractiveness and desirability of the property. Accordingly, the appraiser has assigned a physical condition of average. The house indicates a physical depreciation from the table of 27%. The house would also have an economic depreciation applied typically derived from other house sales in the area.

DWELLING DEPRECIATION TABLE

- 1. Rate the dwelling in terms of its overall physical condition.
- 2. Select the proper depreciation percentage relative to its actual age.

The following is the physical depreciation tables for residential and manufactured homes.

COMMERCIAL/INDUSTRIAL/EXEMPT DEPRECIATION TABLE COMMON CAUSES OF OBSOLESCENCE

In the final analysis, an estimate of depreciation or value loss represents an opinion of the appraiser as to the degree that the present and future appeal of a property has been diminished by deterioration and obsolescence. The accuracy of the estimate will be a product of the appraiser's experience in recognizing the symptoms of deterioration and obsolescence and his ability to exercise sound judgment in equating his observations to the proper monetary allowance to be deducted from the replacement cost new. The following tables have been provided as guidelines to assist the appraiser in arriving at the resultant estimate of the diminishing value of improvements after subtracting all forms of depreciation. Following is a listing of some of the most common sources of functional and economic obsolescence which should further assist him in arriving at a reasonable estimate of obsolescence.

Common Causes of Functional Obsolescence

Poor ratio of land to building area.

Inadequate parking, and/or truck and Railroad loading and unloading facilities.

An appearance unattractive and inconsistent with present use and surrounding properties.

Poor proportion of office, rental, or Manufacturing and warehouse space.

Inadequate or unsuited utility space.

Limited use and excessive material and product handling costs caused by irregular and inefficient floor plans, varying floor elevations, inadequate clearance, and cut up interiors with small bays and excessive number of walls, posts and columns.

Multi-story design when single story would be more efficient and economical.

Excessive or deficient floor load capacity

Insufficient and inadequate elevator service.

High maintenance costs resulting from mixed building constructions and/or the use of obsolete building materials.

Effects of corrosion created by manu facturing, processing, or storing of chemicals.

Foundational and structural failures due to poor soil conditions, poor design, excessive loading, poor maintenance, excessive vibration of building and process equipment.

Inadequate power distribution, heating, ventilation, air condition, or lighting systems.

Common Causes of Economic Obsolescence

Zoning laws and other governmental regulations which affect the usage and operation of the property.

Building code requirements which set current acceptable construction standards.

Market acceptability of the product or services for which the property was constructed or is currently used.

Profitability of the operation of the property and the justifiable investment which the business would support.

Termination of the need for the property due to actual or probable changes in economic or social conditions.

COMMERCIAL/INDUSTRIAL ECONOMIC LIFE GUIDELINES

Economic life is an estimate of the normal life expectancy of a component. The following are some suggested guidelines for the average expected life of various commercial/industrial buildings and yard improvements.

| BUILDINGS | WOOD JOISTS | FIRE RESISTANT | FIRE PROOF |

OTHER BUILDING AND YARD ITEM DEPRECIATION GUIDELINES

The appraisal of other buildings and yard improvements for residential, agricultural, and commercial properties is a difficult task. Other buildings and yard improvements are rarely purchased or sold separately from the balance of the property. The cost of construction of a swimming pool, which is built for the convenience and comfort of a property owner, will rarely add an equivalent amount to the market value of the property. The cost of construction of a farm outbuilding that can be justified by its contribution to the farming operation will again seldom add an equivalent amount to the market value of the property. Cost of the construction of commercial yard item or building is generally intended to supplement the use of the main building on the property.

In effect, other buildings and yard improvements have value in direct proportion to their degree of utility or usefulness. This is an extension of the principle of contribution, which affirms that the value of any factor in production is dependent upon the amount which it contributes to the overall net return, irrespective of the cost of its construction. Any effective approach to the valuation of other buildings and yard improvements must reflect the action of investors. Informed farm owners and operators would not invest in buildings which could not pay for themselves by either maintaining or adding to the required level of productivity. Homeowners would not invest in swimming pools, detached garages, etc., which would not supply the degree of comfort and/or convenience they desire.

Six individual Depreciation Tables have been developed to assist the appraiser in valuing the various other building and yard improvements that are normally encountered. The following is a list of the six tables.

The appraiser needs to look at all three causes; physical, functional and economic depreciation on residential, commercial and miscellaneous outbuildings and yard items.

Final Cost Value

The final step in the cost approach to valuation is to adjust the cost for location and desirability. The cost tables in this manual represent the county in its entirety. Certain neighborhoods require an adjustment to the cost approach due to its location or desirability. This final adjustment is called the market factor. Sales within a neighborhood will give an indication as to whether a positive, negative or no adjustment at all is required. The adjustment will be applied after all cost and depreciation is completed. This is the final improvement value in the cost approach. The land value is then added to the final improvement value to indicate the market value from the cost approach.

SALES COMPARISON APPROACH TO VALUE

In the sales comparison approach the subject property is compared to recently sold properties and adjustments are made to the comparable sales for the differences between the subject property and comparable sales. The sales comparison approach is based primarily on the principle of substitution in that a property is worth no more than what a similar property is bought or sold in the market. The sales comparison approach works best on land and residential properties, but is contingent upon the availability of sales. The approach works well in subdivisions, urban and suburban areas, but is less accurate in rural and agricultural areas where sales are generally less frequent. Gaston County for this reason primarily uses the market backed cost approach in that it is consistent and can be used on all properties. The sales comparison approach is a secondary or back up approach to value.

In order for the sales comparison approach to work properly, valid sales must be used. The sales must meet the definition of market value listed in the North Carolina Machinery Act. Sales also need to be as comparable as possible to the subject property and hopefully located close in proximity to the subject property.

After the sales are selected adjustments may need to be made to the comparable sales. The first adjustment is for time of sale, adjusting to the date of the appraisal. Next would be adjustments for land and location. The following adjustments would be for any variation in the differences between the subject property and the comparable sales. The final process is to analyze the adjusted indicated value of the comparable sales and select the appropriate value of the subject property.

Modeling Summary

For the 2023 Revaluation, Gaston County will utilize Spatialest based property appraisal software toolset for sales analysis and property comparison. This will analyze Gaston County property sales and extract information such as: Size, House Quality, Condition, and other key value drivers, to predict the values of properties. There are two methods used for this process: (1) Multiple Regression Analysis and (2) Comparable Sales Method. These methods can be used independently or in combination with each other.

This program, while used as a tool to assist the appraiser in conducting the county-wide mass appraisal, is best used in subdivisions, cities, or densely developed areas.

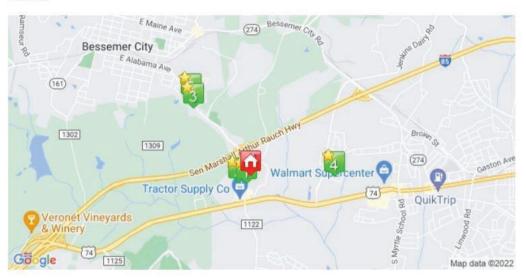

(1) Multiple Regression Analysis: A statistical technique that will use market sales to extract the contributory value of different property characteristics such as: Area, House Quality and Condition, to predict a value. The regression will analyze data in order to predict the value of one variable (the dependent variable) from known values of one or more other variables (the independent variables). This process will then be compared to

the market backed cost approach as a comparison tool. Anything falling outside a 10% range will be analyzed for a second time.

- (2) Comparable Sales Method: This method uses the similarity and proximity of sales and compares them to a subject property. Adjustments for the differences are then made and a market value is predicted. The differences can be adjusted from the sales prices of the comparable properties. The comparable model is set up with adjustment standards or can be adjusted by the appraiser.
- The software allows the user to work with Gaston County data spatially making it easier to identify and illustrate sales patterns, property type groupings and other relevant factors that lead to accurate and equitable valuations.

See below for an example of comparable report.

INCOME APPROACH to VALUE

The Income Approach includes models for the following property groups:

Apartments
Hotels/Motels
General Retail/Shopping Center
General Office/Medical Office
Convenience Stores
Restaurant/Franchise Restaurant
Manufacturing/Warehouse
Mobile Home Parks
Self -Storage
Service Shop/Service Garage

Income and Expense Models are developed for each property group to cover the range of properties located within Gaston County. Income and expense models are based on typical net lease situations. For triple net and other type leases, expense ratios should be adjusted to reflect actual or typical expenses of the landlord in this type of arrangement. Triple net leases have no expenses.

Economic Income is developed on a gross square foot or unit basis. Potential Gross Income is adjusted for occupancy loss to produce an Effective Gross Income. Income and Occupancy factors may be adjusted for exceptional properties on an individual basis.

Expenses for management and marketing, maintenance, utilities, reserve for replacement, and other operating expenses are specified as a percentage of Effective Gross Income. These expenses are deducted from Effective Gross Income to generate a Net Income, which is then capitalized using direct capitalization. The capitalization rate (Cap Rate) used for direct capitalization will need to be loaded to include property tax expense. To load the Cap Rate, simply add the effective tax rate to the overall capitalization rate which is then applied to the NOI.

Income Models include associated capitalization parameters:

- a) Typical financing percentage rates and terms.
- b) Cash on cash requirements.

These capitalization parameters may be adjusted for lower or higher risk properties through an override of the indicated model rates. Capitalization Rates are computed excluding an effective tax rate and applied to the Net Income to generate an indicated value.

| Income Value | | \$1,572,695 |

Land that supports the structure operation is part of the income value. Any additional land that is not part of the operation will be valued as excess land.

SECTION 42 LOW-INCOME HOUSING

North Carolina General Statute 105-277.16

A North Carolina low-income housing development to which the North Carolina Housing Finance Agency allocated a federal tax credit under section 42 of the Code is designated a special class of property under Article V, Section 2(2) of the North Carolina Constitution and must be appraised, assessed, and taxed in accordance with this section. The assessor must use the income approach as the method of valuation for property classified under this section and must take rent restrictions that apply to the property into consideration in determining the income attributable to the property. The assessor may not consider income tax credits received under section 42 of the Code or under G.S. 105-129.42 in determining the income attributable to the property. (2008-146, s. 3.1:2008-187, s. 47.6).

General Application

Identify the low-income housing property being appraised and request copies of the audited financial statements for current year (revaluation year) and three prior years.

Analyze the actual income stream: apply expense ratios, capitalization rates, and Gross Rent Multipliers (GRM) developed for use in the 2023 Gaston County Revaluation Project.

Vacancy Rates

A normal rate of 3-5% has been adopted for use by Gaston County.

Operating Expenses

An average expense ratio of 50% to 60% has been adopted for use by Gaston County. The expense ratio includes reserve for replacement but not property tax expenses. The property tax expense is loaded in the cap rate.

Capitalization Rate

A capitalization rate of .060 to .075 was selected for use in Section 42 low-income housing appraisal.

SAMPLE INCOME APPROACH APPRAISAL SECTION 42 LOW INCOME HOUSING (G.S. 105-277.16)

100 UNIT APARTMENT COMPLEX @ \$610 PER MONTH BASE RENT

| APPRAISED VALUE | \$4,756,930 |
| VALUE PER UNIT | \$47,570 |

INCOME APPROACH TO GOLF COURSE

The Income Approach is typically the most accurate measure of value for golf courses. It reduces the differences between golf courses to the least common denominator, **Golf Income Revenue (GIR).** This revenue can be quantified from the market place and analyzed based on actual or anticipated number of rounds played and average daily rates per round.

Following is the formula for estimating the value of golf courses in Gaston County, based on the Income Approach.

Stabilized # Rounds (SNR) x Stabilized Daily Rate (SDR) = Golf Income Revenue (GIR) x Golf Income Multiplier (GIM) = Indicated Value

EXAMPLE

Catapult Golf Club – an 18 hole, regulation size golf course, with a stabilized number of rounds of 20,000 per year and a stabilized daily rate of \$50.

 $20,000 \times \$50 = \$1,000,000 \times 2.0 = \$2,000,000 \text{ or } \$111,100 \text{ per hole.}$ (SNR) x (SDR) = (GIR) x (GIM) = Indicated Value

GOLF COURSE INCOME MODELS

| GRADE | STABILIZED | RATES DAILY & | SATBILIZED | GIM |
|-----------|---------------|----------------|---------------|------------|
| | # ROUNDS | SEASONAL | RATE | |
| EXCELLENT | 20,000-30,000 | \$100 to \$250 | \$75 to \$200 | 1.0 to 2.5 |
| VERY GOOD | 20,000-30,000 | \$45 to \$150 | \$50 to \$100 | 1.0 to 2.5 |
| GOOD | 20,000-30,000 | \$30 to \$125 | \$40 to \$75 | 1.0 to 2.5 |
| AVERAGE | 20,000-30,000 | \$25 to \$60 | \$30 to \$60 | 1.0 to 2.5 |
| FAIR | 15,000-20,000 | \$15 to \$25 | \$15 to \$25 | 1.0 to 2.5 |
| PAR 3 | 15,000-20,000 | \$10 to \$25 | \$10 to \$25 | 1.0 to 2.5 |

Note: Stabilized Daily Rates include cart rental and green fees only. Values generated by this formula are for golf course improvements and the land necessary to support the golf holes. Values for excess land and other buildings will be added based on separate cost or income analysis as outlined within the body of the Schedule of Values.

Residential Income

One to four unit buildings will be valued as residential property. Residential property is valued using GRM or Gross Monthly Multiplier. The GRM will range from 160 to 200 with normal being 170 to 185.

Example: House rents for \$800 a month and using a 180 GRM. $$800 \times 180 = $144,000$

Single family homes, due to limitation of establishing data, is best valued through sales comparison.

STANDARD REVIEW PROCEDURES

| <u>Level of Value</u> - Acceptable Range | 2022 Sales | 95% - 105% |
|--|------------|-------------|
| | 2021 Sales | 110% - 130% |
| | 2020 Sales | 125% - 150% |

There is a broader range in older sale years due to the economic variations in sales price in different locations of property in the county.

Remember our primary concern is to have equalization and consistency for all property.

Appraisal Date - Target date is January 1, 2023.

All sales data, building ages, depreciation, etc., is to be measured from January 1, 2023.

<u>Incorrect data elements encountered on review</u> - It is the responsibility of the reviewer to list all incorrect measurements or new attachments or new outbuildings on the pre-review form.

Demolished or Razed Building Encountered on Review

Procedure:

- 1. Delete building sketch and all information on card.
- 2. Change occupancy from Improved to Vacant.
- 3. Put proper note in sketch area.

Example: Dwelling razed as of 10-01-20

<u>Commercial/Industrial Parcels</u> - It is the reviewer's responsibility to look and verify that all parcels not reviewed, because they are coded commercial or industrial, fit the definition and are not simply a house similar to the last 50 parcels reviewed with a beauty shop in the basement. Do not interpret this instruction to mean the residential reviewer should attempt to review legitimate commercial or industrial parcels, vacant or improved.

<u>Record Keeping</u> - One of the objectives of the project is to keep paperwork and accounting to a bare minimum. The records you will maintain are important and mandatory for a successful operation. Unless directed otherwise by future policy change, the reviewer is responsible for the following:

- 1. Individual Production Record To be maintained on a daily basis.
- 2. <u>Incorrect Data List</u> List all data changes that need to be measured on an incorrect data log by neighborhood.
- 3. <u>Production Control Form</u> To be maintained on an ongoing basis per your detailed instructions.

Main Elements - Cards not listed or reviewed.

Reviewer's initials and date completed.

Total card count.

<u>Dwelling In Commercial Areas</u> - You are requested to not review those parcels affected by a commercial or industrial land value influence. If he/she has entered a residential street price you are to review all parcels on that block except individual commercial or industrial parcels. This

usually will be a spot zoning or non-conforming zoning situation. In most of the situations, the commercial reviewer will establish a land value based on commercial use and zoning and will treat the dwelling as a mis-improvement to the land. It makes a big difference in the condition rating! Remember that, for a multiple sequence of cards on one parcel, no cards are considered reviewed if all cards in the sequence, including the land value, are completed. If you had a gas station and a dwelling on the same parcel, leave all cards alone and indicate all cards not reviewed.

All buildings not complete by January 1st 2023 must be valued as a percent complete.

This guide is to be used in estimating the percentage of completion of both residential and commercial buildings under construction.

PERCENT COMPLETION GUIDE

| FOUNDATION ONLY | .10% |
|--------------------------------------|------|
| FRAMING IN PLACE | 25% |
| ROUGH INTERIOR | 50% |
| FINISH INTERIOR | 75% |
| INTERIOR & EXTERIOR DECORATION | 90% |
| WORKING UTILITIES, BUILDING COMPLETE | 100% |

SPECIFIC REVIEW PROCEDURES

- 1. Take the following materials to the field.
 - a. Computer listed property cards
 - b. Neighborhood maps/land pricing sheets
 - c. Laptop with mapping and photo file
 - d. Camera
 - e. Measuring Device
- 2. Familiarize yourself with the review area.
- 3. Property location Check property location and provide street numbers if missing; note on address mismatch document if address is not accurate.
- 4. Change property use codes to reflect the actual use of the property.
- 5. Area Check for proper neighborhood code; change if not correct. If you feel there should be major neighborhood changes, consult your supervisor.
- 6. Parcel number Make sure that you are reviewing the proper dwelling or lot by comparing the parcel I.D. on the card with the parcel I.D. on the map.
- 7. Land data Check for accuracy of lot size or land breakdown and correct if necessary. Check for influence factor (i.e. topography or size) and adjust if necessary. Check unit price to be sure that all parcels in neighborhood group are being priced consistently. Do not attempt to change any land rates until you consult your supervisor.
- 8. Listing data Review all dwelling and other buildings for accuracy and adequacy of data. Make necessary corrections to sketches or characteristics.
- 9. Grade Assign a quality grade to the structure based on project guidelines.
- 10. Year built Confirm or correct actual year built and effective year built.

- 11. Depreciation Assign condition rating to dwelling based on age and condition. Add function or economic depreciation if required.
- 12. Parcel summary Check indicated value in comparison with sales in neighborhood.
- 15. Photo Check photo of building to make sure it is correct and looks like the current condition of building.
- 16. Mapping problems Notify mapping department of mapping problem.

PRESENT USE SCHEDULES

§ 105-277.2. Agricultural, horticultural, and forestland – Definitions.

The following definitions apply in G.S. 105-277.3 through G.S. 105-277.7:

- Agricultural land. Land that is a part of a farm unit that is actively engaged in the commercial production or growing of crops, plants, or animals under a sound management program. For purposes of this definition, the commercial production or growing of animals includes the rearing, feeding, training, caring, and managing of horses. Agricultural land includes woodland and wasteland that is a part of the farm unit, but the woodland and wasteland included in the unit must be appraised under the use-value schedules as woodland or wasteland. A farm unit may consist of more than one tract of agricultural land, but at least one of the tracts must meet the requirements in G.S. 105-277.3(a) (1), and each tract must be under a sound management program. If the agricultural land includes less than 20 acres of woodland, then the woodland portion is not required to be under a sound management program. Also, woodland is not required to be under a sound management program if it is determined that the highest and best use of the woodland is to diminish wind erosion of adjacent agricultural land, protect water quality of adjacent agricultural land, or serve as buffers for adjacent livestock or poultry operations.
- (1a) Business entity. A corporation, a general partnership, a limited partnership, or a limited liability company.
- (2) Forestland. Land that is a part of a forest unit that is actively engaged in the commercial growing of trees under a sound management program. Forestland includes wasteland that is a part of the forest unit, but the wasteland included in the unit must be appraised under the use-value schedules as wasteland. A forest unit may consist of more than one tract of forestland, but at least one of the tracts must meet the requirements in G.S. 105-277.3(a) (3), and each tract must be under a sound management program.
- (3) Horticultural land. – Land that is a part of a horticultural unit that is actively engaged in the commercial production or growing of fruits or vegetables or nursery or floral products under a sound management program. Horticultural land includes woodland and wasteland that is a part of the horticultural unit, but the woodland and wasteland included in the unit must be appraised under the use-value schedules as woodland or wasteland. A horticultural unit may consist of more than one tract of horticultural land, but at least one of the tracts must meet the requirements in G.S. 105-277.3(a) (2), and each tract must be under a sound management program. If the horticultural land includes less than 20 acres of woodland, then the woodland portion is not required to be under a sound management program. Also, woodland is not required to be under a sound management program if it is determined that the highest and best use of the woodland is to diminish wind erosion of adjacent horticultural land or protect water quality of adjacent horticultural land. Land used to

grow horticultural and agricultural crops on a rotating basis or where the horticultural crop is set out or planted and harvested within one growing season, may be treated as agricultural land as described in subdivision (1) of this section when there is determined to be no significant difference in the cash rental rates for the land.

- (4) Individually owned. Owned by one of the following:
 - a. An individual.
 - b. A business entity that meets all of the following conditions:
 - Its principal business is farming agricultural land, horticultural land, or forestland. When determining whether an applicant under G.S. 105-277.4 has as its principal business farming agricultural land, horticultural land, or forestland, the assessor shall presume the applicant's principal business to be farming agricultural land, horticultural land, or forestland if the applicant has been approved by another county for present-use value taxation for a qualifying property located within the other county; provided, however, the presumption afforded the applicant may be rebutted by the assessor and shall have no bearing on the determination of whether the individual parcel of land meets one or more of the classes defined in G.S. 105-277.3(a). If the assessor is able to rebut the presumption, this shall not invalidate the determination that the applicant's principal business is farming agricultural land, horticultural land, or forestland in the other county.
 - All of its members are, directly or indirectly, individuals who are actively engaged in farming agricultural land, horticultural land, or forestland or a relative of one of the individuals who is actively engaged. An individual is indirectly a member of a business entity that owns the land if the individual is a member of a business entity or a beneficiary of a trust that is part of the ownership structure of the business entity that owns the land.
 - 3. It is not a corporation whose shares are publicly traded, and none of its members are corporations whose shares are publicly traded.
 - 4. If it leases the land, all of its members are individuals and are relatives. Under this condition, "principal business" and "actively engaged" include leasing.
 - c. A trust that meets all of the following conditions:
 - 1. It was created by an individual who owned the land and transferred the land to the trust.
 - 2. All of its beneficiaries are, directly or indirectly, individuals who are the creator of the trust or a relative of the creator. An individual is indirectly a beneficiary of a trust that owns the land if the individual is a beneficiary of another trust or

a member of a business entity that has a beneficial interest in the trust that owns the land.

- d. A testamentary trust that meets all of the following conditions:
 - 1. It was created by an individual who transferred to the trust land that qualified in that individual's hands for classification under G.S. 105-277.3.
 - 2. At the date of the creator's death, the creator had no relatives.
 - 3. The trust income, less reasonable administrative expenses, is used exclusively for educational, scientific, literary, cultural, charitable, or religious purposes as defined in G.S. 105-278.3(d).
- e. Tenants in common, if each tenant would qualify as an owner if the tenant were the sole owner. Tenants in common may elect to treat their individual shares as owned by them individually in accordance with G.S. 105-302(c) (9). The ownership requirements of G.S. 105-277.3(b) apply to each tenant in common who is an individual, and the ownership requirements of G.S. 105-277.3(b1) apply to each tenant in common who is a business entity or a trust.
- (4a) Member. A shareholder of a corporation, a partner of a general or limited partnership, or a member of a limited liability company.
- (5) Present-use value. The value of land in its current use as agricultural land, horticultural land, or forestland, based solely on its ability to produce income and assuming an average level of management. A rate of nine percent (9%) shall be used to capitalize the expected net income of forestland. The capitalization rate for agricultural land and horticultural land is to be determined by the Use-Value Advisory Board as provided in G.S. 105-277.7.
- (5a) Relative. Any of the following:
 - a. A spouse or the spouse's lineal ancestor or descendant.
 - b. A lineal ancestor or a lineal descendant.
 - c. A brother or sister, or the lineal descendant of a brother or sister. For the purposes of this sub-subdivision, the term brother or sister includes stepbrother or stepsister.
 - d. An aunt or an uncle.
 - e. A spouse of an individual listed in paragraphs a. through d. For the purpose of this subdivision, an adoptive or adopted relative is a relative and the term "spouse" includes a surviving spouse.
- (6) Sound management program. A program of production designed to obtain the greatest net return from the land consistent with its conservation and long-term improvement.
- (7) Unit. One or more tracts of agricultural land, horticultural land, or forestland. Multiple tracts must be under the same ownership and be of the same type of classification. If the multiple tracts are located within different counties, they must be within 50 miles of a tract qualifying under G.S. 105-277.3(a). (1973, c. 709, s. 1; 1975, c. 746, s. 1; 1985, c. 628, s. 1; c. 667, ss. 1, 4; 1987, c. 698, s. 1; 1995, c. 454, s. 1; 1995 (Reg. Sess.,

996), c. 646, s. 17; 1998-98, s. 24; 2002-184, s. 1; 2004-8, s. 1; 2005-313, ss. 1, 2; 2008-146, s. 2.1; 2015-263, s. 12(a).)

§ 105-277.3. Agricultural, horticultural, and forestland – Classifications.

- (a) Classes Defined. The following classes of property are designated special classes of property under authority of Section 2(2) of Article V of the North Carolina Constitution and must be appraised, assessed, and taxed as provided in G.S. 105-277.2 through G.S. 105-277.7.
 - (1) Agricultural land. Individually owned agricultural land consisting of one or more tracts, one of which satisfies the requirements of this subdivision. For agricultural land used as a farm for aquatic species, as defined in G.S. 106-758, the tract must meet the income requirement for agricultural land and must consist of at least five acres in actual production or produce at least 20,000 pounds of aquatic species for commercial sale annually, regardless of acreage. For all other agricultural land, the tract must meet the income requirement for agricultural land and must consist of at least 10 acres that are in actual production. Land in actual production includes land under improvements used in the commercial production or growing of crops, plants, or animals.

To meet the income requirement, agricultural land must, for the three years preceding January 1 of the year for which the benefit of this section is claimed, have produced an average gross income of at least one thousand dollars (\$1,000). Gross income includes income from the sale of the agricultural products produced from the land, any payments received under a governmental soil conservation or land retirement program, and the amount paid to the taxpayer during the taxable year pursuant to P.L. 108-357, Title VI, Fair and Equitable Tobacco Reform Act of 2004.

- (2) Horticultural land. Individually owned horticultural land consisting of one or more tracts, one of which consists of at least five acres that are in actual production and that, for the three years preceding January 1 of the year for which the benefit of this section is claimed, have met the applicable minimum gross income requirement. Land in actual production includes land under improvements used in the commercial production or growing of fruits or vegetables or nursery or floral products. Land that has been used to produce evergreens intended for use as Christmas trees must have met the minimum gross income requirements established by the Department of Revenue for the land. All other horticultural land must have produced an average gross income of at least one thousand dollars (\$1,000). Gross income includes income from the sale of the horticultural products produced from the land and any payments received under a governmental soil conservation or land retirement program.
- (3) Forestland. Individually owned forestland consisting of one or more tracts, one of which consists of at least 20 acres that are in actual production and are not included in a farm unit.
- (b) Individual Ownership Requirements. In order to come within a classification described in subsection (a) of this section, land owned by an individual must also satisfy one

of the following conditions:

- (1) It is the owner's place of residence.
- (2) It has been owned by the current owner or a relative of the current owner for the four years preceding January 1 of the year for which the benefit of this section is claimed.
- (3) At the time of transfer to the current owner, it qualified for classification in the hands of a business entity or trust that transferred the land to the current owner who was a member of the business entity or a beneficiary of the trust, as appropriate.
- (b1) Entity Ownership Requirements. In order to come within a classification described in subsection (a) of this section, land owned by a business entity must meet the requirements of subdivision (1) of this subsection and land owned by a trust must meet the requirements of subdivision (2) of this subsection.
 - (1) Land owned by a business entity must have been owned by one or more of the following for the four years immediately preceding January 1 of the year for which the benefit of this section is claimed:
 - a. The business entity.
 - b. A member of the business entity.
 - c. Another business entity whose members include a member of the business entity that currently owns the land.
 - (2) Land owned by a trust must have been owned by the trust or by one or more of its creators for the four years immediately preceding January 1 of the year for which the benefit of this section is claimed.
- (b2) Exceptions to Ownership Requirements. Notwithstanding the provisions of subsections (b) and (b1) of this section, land may qualify for classification in the hands of the new owner if all of the conditions listed in either subdivision of this subsection are met, even if the new owner does not meet all of the ownership requirements of subsections (b) and (b1) of this section with respect to the land.
 - (1) Continued use. If the land qualifies for classification in the hands of the new owner under the provisions of this subdivision, then any deferred taxes remain a lien on the land under G.S. 105-277.4(c), the new owner becomes liable for the deferred taxes, and the deferred taxes become payable if the land fails to meet any other condition or requirement for classification. Land qualifies for classification in the hands of the new owner if all of the following conditions are met:
 - a. The land was appraised at its present use value at the time title to the land passed to the new owner.
 - b. The new owner acquires the land and continues to use the land for the purpose for which it was classified under subsection (a) of this section while under previous ownership.
 - (2) The new owner has timely filed an application as required by G.S. 105-277.4(a) and has certified that the new owner accepts liability for any deferred taxes and intends to continue the present use of the land. Expansion of existing unit. Land qualifies for classification in the hands of the new owner if, at the time title passed to the new owner, the land was not appraised at its present-use value but was being used for the same

purpose and was eligible for appraisal at its present-use value as other land already owned by the new owner and classified under subsection (a) of this section. The new owner must timely file an application as required by G.S. 105-277.4(a).

- (c) Repealed by Session Laws 1995, c. 454, s. 2.
- (d) Exception for Conservation Reserve Program. Land enrolled in the federal Conservation Reserve Program authorized by 16 U.S.C. Chapter 58 is considered to be in actual production, and income derived from participation in the federal Conservation Reserve Program may be used in meeting the minimum gross income requirements of this section either separately or in combination with income from actual production. Land enrolled in the federal Conservation Reserve Program must be assessed as agricultural land if it is planted in vegetation other than trees, or as forestland if it is planted in trees.
- (d1) Conservation Exception. Property that is appraised at its present-use value under G.S. 105-277.4(b) shall continue to qualify for appraisal, assessment, and taxation as provided in G.S. 105-277.2 through G.S. 105-277.7 as long as (i) the property is subject to a qualifying conservation easement that meets the requirements of G.S. 113A-232, without regard to actual production or income requirements of this section; and (ii) the taxpayer received no more than seventy-five percent (75%) of the fair market value of the donated property interest in compensation. Notwithstanding G.S. 105-277.3(b) and (b1), subsequent transfer of the property does not extinguish its present-use value eligibility as long as the property remains subject to a qualifying conservation easement. The exception provided in this subsection applies only to that part of the property that is subject to the easement.
- (d2) Wildlife Exception. When an owner of land classified under this section does not transfer the land and the land becomes eligible for classification under G.S. 105-277.15, no deferred taxes are due. The deferred taxes remain a lien on the land and are payable in accordance with G.S. 105-277.15.
 - (d3) Site Infrastructure Exception. When an owner of land classified under this section (i) does not transfer the land and the land becomes eligible for classification under G.S. 105-277.15A or (ii) does transfer the land but the land becomes eligible for classification under G.S. 105-277.15A within six months of the transfer, no deferred taxes are due. The deferred taxes remain a lien on the land and are payable in accordance with G.S. 105-277.15A.
- (e) Exception for Turkey Disease. Agricultural land that meets all of the following conditions is considered to be in actual production and to meet the minimum gross income requirements:
 - (1) The land was in actual production in turkey growing within the preceding two years and qualified for present use value treatment while it was in actual production.
 - (2) The land was taken out of actual production in turkey growing solely for health and safety considerations due to the presence of Poult Enteritis Mortality Syndrome among turkeys in the same county or a neighboring county.
 - (3) The land is otherwise eligible for present use value treatment.
- (f) Sound Management Program for Agricultural Land and Horticultural Land. If the property owner demonstrates any one of the following factors with respect to agricultural land or horticultural land, then the land is operated under a sound management program:

- (1) Enrollment in and compliance with an agency-administered and approved farm management plan.
- (2) Compliance with a set of best management practices.
- (3) Compliance with a minimum gross income per acre test.
- (4) Evidence of net income from the farm operation.
- (5) Evidence that farming is the farm operator's principal source of income.
- (6) Certification by a recognized agricultural or horticultural agency within the county that the land is operated under a sound management program.

Operation under a sound management program may also be demonstrated by evidence of other similar factors. As long as a farm operator meets the sound management requirements, it is irrelevant whether the property owner received income or rent from the farm operator.

(g) Sound Management Program for Forestland. – If the owner of forestland demonstrates that the forestland complies with a written sound forest management plan for the production and sale of forest products, then the forestland is operated under a sound management program. (1973, c. 709, s. 1; 1975, c. 746, s. 2; 1983, c. 821; c. 826; 1985, c. 667, ss. 2, 3, 6.1; 1987, c. 698, ss. 2-5; 1987 (Reg. Sess., 1988), c. 1044, s. 13.1; 1989, cc. 99, 736, s. 1; 1989 (Reg. Sess., 1990), c. 814, s. 29; 1995, c. 454, s. 2; 1997-272, s. 1; 1998-98, s. 22; 2001-499, s. 1; 2002-184, s. 2; 2005-293, s. 1; 2005-313, s. 3; 2007-484, s. 43.7T(c); 2007-497, s. 3.1; 2008-146, s. 2.2; 2008-171, ss. 4, 5; 2011-9, s. 1; 2013-130, s. 2; 2014-3, s. 14.14(a).)

§ 105-277.4. Agricultural, horticultural and forestland – Application; appraisal at use value; appeal; deferred taxes.

- (a) Application. Property coming within one of the classes defined in G.S. 105-277.3 is eligible for taxation on the basis of the value of the property in its present use if a timely and proper application is filed with the assessor of the county in which the property is located. The application must clearly show that the property comes within one of the classes and must also contain any other relevant information required by the assessor to properly appraise the property at its present-use value. An initial application must be filed during the regular listing period of the year for which the benefit of this classification is first claimed, or within 30 days of the date shown on a notice of a change in valuation made pursuant to G.S. 105-286 or G.S. 105-287. A new application is not required to be submitted unless the property is transferred or becomes ineligible for use-value appraisal because of a change in use or acreage. An application required due to transfer of the land may be submitted at any time during the calendar year but must be submitted within 60 days of the date of the property's transfer.
- (a1) Late Application. Upon a showing of good cause by the applicant for failure to make a timely application as required by subsection (a) of this section, an application may be approved by the board of equalization and review or, if that board is not in session, by the board of county commissioners. An untimely application approved under this subsection applies only to property taxes levied by the county or municipality in the calendar year in which the untimely application is filed. Decisions of the county board may be appealed to the Property Tax Commission.
- (b) Appraisal at Present-use Value. Upon receipt of a properly executed application, the assessor must appraise the property at its present-use value as established in the schedule prepared pursuant to G.S. 105-317. In appraising the property at its present-use value, the

assessor must appraise the improvements located on qualifying land according to the schedules and standards used in appraising other similar improvements in the county. If all or any part of a qualifying tract of land is located within the limits of an incorporated city or town, or is property annexed subject to G.S. 160A-37(f1) or G.S. 160A-49(f1), the assessor must furnish a copy of the property record showing both the present-use appraisal and the valuation upon which the property would have been taxed in the absence of this classification to the collector of the city or town. The assessor must also notify the tax collector of any changes in the appraisals or in the eligibility of the property for the benefit of this classification. Upon a request for a certification pursuant to G.S. 160A-37(f1) or G.S.160A-49(f1), or any change in the certification, the assessor for the county where the land subject to the annexation is located must, within 30 days, determine if the land meets the requirements of G.S. 160A-37(f1) (2) or G.S. 160A-49(f1) (2) and report the results of its findings to the city.

- (b1) Appeal. Decisions of the assessor regarding the qualification or appraisal of property under this section may be appealed to the county board of equalization and review or, if that board is not in session, to the board of county commissioners. An appeal must be made within 60 days after the decision of the assessor. If an owner submits additional information to the assessor pursuant to G.S. 105-296(j), the appeal must be made within 60 days after the assessor's decision based on the additional information. Decisions of the county board may be appealed to the Property Tax Commission.
- (c) Deferred Taxes. Land meeting the conditions for classification under G.S. 105-277.3 must be taxed on the basis of the value of the land for its present use. The difference between the taxes due on the present-use basis and the taxes that would have been payable in the absence of this classification, together with any interest, penalties, or costs that may accrue thereon, are a lien on the real property of the taxpayer as provided in G.S. 105-355(a). The difference in taxes must be carried forward in the records of the taxing unit or units as deferred taxes. The deferred taxes for the preceding three fiscal years are due and payable in accordance with G.S. 105-277.1F when the property loses its eligibility for deferral as a result of a disqualifying event. A disqualifying event occurs when the land fails to meet any condition or requirement for classification or when an application is not approved.
 - (d) (Effective for taxes imposed for taxable years beginning before July 1, 2016) Exceptions. Notwithstanding the provisions of subsection (c) of this section, if property loses its eligibility for present use value classification solely due to one of the following reasons, no deferred taxes are due and the lien for the deferred taxes is extinguished:
 - (1) There is a change in income caused by enrollment of the property in the federal conservation reserve program established under 16 U.S.C. Chapter 58.
 - (2) The property is conveyed by gift to a nonprofit organization and qualifies for exclusion from the tax base pursuant to G.S. 105-275(12) or G.S. 105-275(29).
 - (3) The property is conveyed by gift to the State, a political subdivision of the State, or the United States.
- (d) (Effective for taxes imposed for taxable years beginning on or after July 1, 2016) Set Exception. Notwithstanding the provisions of subsection (c) of this section, if property loses its eligibility for present use value classification solely due to a change in income caused

by enrollment of the property in the federal conservation reserve program established under 16U.S.C. Chapter 58, then no deferred taxes are due and the lien for the deferred taxes is extinguished.

- (d1) (Effective for taxes imposed for taxable years beginning on or after July 1, 2016) Variable Exception. Notwithstanding the provisions of subsection (c) of this section, if property loses its eligibility for present-use value classification because the property is conveyed to a nonprofit organization and qualifies for exclusion from the tax base pursuant to 105-275(12) or G.S. 105-275(29) or to the State, a political subdivision of the State, or the United States, then deferred taxes are due as follows:
 - (1) If the property is conveyed at or below present-use value, then no deferred taxes are due, and the lien for the deferred taxes is extinguished.
 - (2) If the property is conveyed for more than present-use value, then a portion of the deferred taxes for the preceding three fiscal years is due and payable in accordance with G.S. 105-277.1F. The portion due is equal to the lesser of the amount of the deferred taxes or the deferred taxes multiplied by a fraction, the numerator of which is the sale price of the property minus the present-use value of the property and the denominator of which is the true value of the property minus the present-use value of the property.
 - (d) Repealed by Session Laws 1997-270, s. 3, effective July 3, 1997.
 - (e) The Department shall publish a present-use value program guide annually and make the guide available electronically on its Web site. When making decisions regarding the qualifications or appraisal of property under this section, the assessor shall adhere to the Department's present-use value program guide. (1973, c. 709, s. 1; c. 905; c. 906, ss. 1, 2; 1975, c. 62; c. 746, ss. 3-7; 1981, c. 835; 1985, c. 518, s. 1; c. 667, ss. 5, 6; 1987, c. 45, s. 1; c. 295, s. 5; c. 698, s. 6; 1987 (Reg. Sess., 1988), c. 1044, s. 13.2; 1995, c. 443, s. 4; c. 454, s. 3; 1997-270, s. 3; 1998-98, s. 23; 1998-150, s. 1; 2001-499, s. 2; 2002-184, s. 3; 2005-313, s. 4; 2006-30, s. 4; 2008-35, s. 2.3; 2015-263, s. 12(b); 2016-76, s. 1.)

§ 105-277.5. Agricultural, horticultural and forestland – Notice of change in use.

Not later than the close of the listing period following a change which would disqualify all or a part of a tract of land receiving the benefit of this classification, the property owner shall furnish the assessor with complete information regarding such change. Any property owner who fails to notify the assessor of changes as aforesaid regarding land receiving the benefit of this classification shall be subject to a penalty of ten percent (10%) of the total amount of the deferred taxes and interest thereon for each listing period for which the failure to report continues. (1973, c. 709, s. 1; 1975, c. 746, s. 8; 1987, c. 45, s. 1.)

§ 105-277.6. Agricultural, horticultural and forestland – Appraisal; computation of deferred tax.

- (a) In determining the amount of the deferred taxes herein provided, the assessor shall use the appraised valuation established in the county's last general revaluation except for any changes made under the provisions of G.S. 105-287.
- (b) In revaluation years, as provided in G.S. 105-286, all property entitled to classification under G.S. 105-277.3 shall be reappraised at its true value in money and at its present use value as of the effective date of the revaluation. The two valuations shall continue

in effect and shall provide the basis for deferred taxes until a change in one or both of the appraisals is required by law. The present use-value schedule, standards, and rules shall be used by the tax assessor to appraise property receiving the benefit of this classification until the next general revaluation of real property in the county as required by G.S. 105-286.

(c) Repealed by Session Laws 1987, c. 295, s. 2. (1973, c. 709, s. 1; 1975, c. 746, ss. 9, 10; 1987, c. 45, s. 1, c. 295, s. 2.)

§ 105-296. Powers and duties of assessor

(J) The assessor must annually review at least one eighth of the parcels in the county classified for taxation at present-use value to verify that these parcels qualify for the classification. By this method, the assessor must review the eligibility of all parcels classified for taxation at present-use value in an eight-year period. The period of the review process is based on the average of the preceding three years' data. The assessor may request assistance from the Farm Service Agency, the Cooperative Extension Service, the North Carolina Forest Service of the Department of Agriculture and Consumer Services, or other similar organizations.

The assessor may require the owner of classified property to submit any information, including sound management plans for forestland, needed by the assessor to verify that the property continues to qualify for present-use value taxation. The owner has 60 days from the date a written request for the information is made to submit the information to the assessor. If the assessor determines the owner failed to make the information requested available in the time required without good cause, the property loses its present-use value classification and the property's deferred taxes become due and payable as provided in G.S. 105-277.4(c). If the property loses its present-use value classification for failure to provide the requested information, the assessor must reinstate the property's present-use value classification when the owner submits the requested information within 60 days after the disqualification unless the information discloses that the property no longer qualifies for present-use value classification. When a property's present-use value classification is reinstated, it is reinstated retroactive to the date the classification was revoked and any deferred taxes that were paid as a result of the revocation must be refunded to the property owner. The owner may appeal the final decision of the assessor to the county board of equalization and review as provided in G.S. 105-277.4(b1).

Present Use Rates Per Acre

The value per acre for property qualified under present use is as follows:

Agricultural Land

| A1 Agricultural Class 1 | \$950 |
|-------------------------|-------|
| A2 Agricultural Class 2 | \$645 |
| A3 Agricultural Class 3 | \$420 |
| A4 Agricultural Class 4 | \$ 40 |

Agricultural Land

| H1 Horticultural Class 1 | \$1370 |
|--------------------------|--------|
| H2 Horticultural Class 2 | \$ 890 |
| H3 Horticultural Class 3 | \$ 615 |

| H4 Horticultural Class 4 \$ 4 | H4 | Horticu | ltural | Class | 4 | \$ | 40 |) |
|-------------------------------|----|---------|--------|-------|---|----|----|---|
|-------------------------------|----|---------|--------|-------|---|----|----|---|

Forest Land

| F1 Forestland Class 1 | \$410 |
|-----------------------|-------|
| F2 Forestland Class 2 | \$280 |
| F3 Forestland Class 3 | \$250 |
| F4 Forestland Class 4 | \$180 |
| F5 Forestland Class 5 | \$135 |
| F6 Forestland Class 6 | \$ 40 |

Wildlife Conservation

| WL1 Wildlife Conservation Land Class 1 | \$950 |
|--|-------|
| WL2 Wildlife Conservation Land Class 2 | \$645 |
| WL3 Wildlife Conservation Land Class 3 | \$420 |
| WL4 Wildlife Conservation Land Class 4 | \$ 40 |

SUPPLEMENTAL DATA

Zoning - Statutory Requirements

G. S. 105 - 317(a) (1)

"In determining the true value of land, to consider as to each tract, parcel, or lot separately listed at least its advantages and disadvantages as to location; zoning; quality of soil; waterpower; water privileges; dedication as a nature preserve; mineral, quarry, or other valuable deposits; fertility; adaptability for agricultural, timber-producing, commercial, industrial, or other uses; past income; probable future income; and any other factors that may affect its value except growing crops of a seasonal or annual nature."

The regulated or legally allowable use of a property by a zoning authority can impact its value. A parcel of land that is within a commercially zoned area could bring a higher price in the marketplace than an otherwise comparable property with a lesser or more restricted zoning.

The following list of zoning codes and districts are extracted from the Gaston County Zoning Ordinance for Unincorporated Areas - Chapter 3.

The list of zoning districts within the various municipalities located in Gaston County is considered current at the time of the publication of these schedules and may be subject to change as deemed appropriate by the zoning authorities for these jurisdictions.

Zoning changes within the reappraisal period will be considered by the Gaston County Tax Office and may result in a change of land type and/or classification or neighborhood association. Any of these changes could cause an increase or decrease in the overall valuation for the affected property.

TABLE OF CONTENTS

SECTION NUMBER NAMESTARTS AT PAGE

- 6.1 Zoning Districts Established 6-1
- 6.2 General Zoning Districts 6-2
- 6.3 Overlay Zoning Districts 6-9
- 6.4 Parallel Conditional Use Zoning (PCUP) Districts 6-12
- 6.5 Conditional Zoning (CD) Districts 6-13

SECTION 6.1 ZONING DISTRICTS ESTABLISHED

- A. In order to achieve the purposes established for this Ordinance as indicated in Section 6.2, and to further the goals and objectives stated in any plans for the future development of Gaston County as adopted by the governing board, a number of zoning districts are hereby created. Districts are divided into the following four categories:
- 1. General zoning districts
- 2. Overlay districts

- 3. Parallel conditional use districts
- 4. Conditional districts
- B. Each general zoning district category serves a different function. A number of "residential," "commercial," "office" and "industrial" zoning districts have been created. Most allow for a variety of land use types and categories; certain districts allow for the mixing of land use types is encouraged. All of the geographic area to which this Ordinance applies shall be divided into one of the various general zoning districts.
- C. Overlay districts are created to address issues of particular concern in the community that overlay one (1) or more of the general zoning districts. These regulations supplement those that are found in the underlying general zoning district. Any proposed use located within an overlay district would have to meet the requirements of the underlying general zoning district along with the requirements of the overlay district.
- D. Parallel Conditional Use Districts (PCUP) are established to consider situations where a particular use may be acceptable on a lot or tract of land but the other uses permitted in a General Zoning District would not be acceptable. In such instances, the Board of Commissioners may elect to rezone the lot(s) in question to a Parallel Conditional Use District (PCUP). Such rezoning may be made contingent upon the property owner meeting fair and reasonable conditions which assure the compatibility of the use with surrounding properties and promote the general welfare of the community. A parallel conditional use rezoning requires two (2) steps: (i) the rezoning to a parallel conditional use district and (ii) the issuance of a conditional use permit, the latter being done through a quasi-judicial process. Zoning to a PCUP District shall be a voluntary procedure on the part of the property owner or his agent and is intended for firm development proposals. It is not intended for securing early zoning for tentative proposals.
- E. Conditional Zoning Districts (CD) are designed to reach the same end-result as parallel conditional use districts. Conditional zoning involves the creation of a completely new zoning district designed to serve the needs of a particular development. No conditional use permit is involved, nor are there any quasi-judicial procedures. Two (2) Public Information Meetings (PIMs) are required to be held by the applicant. This is a legislative process type of rezoning. The owner of the property in question, or his authorized agent, are the only persons who can request a conditional district rezoning.

SECTION 6.2 GENERAL ZONING DISTRICTS

6.2.1 RESIDENTIAL DISTRICTS

A. R-1 SINGLE FAMILY LIMITED

The purpose of this district is to accommodate single family site built and modular construction. The minimum lot size allowed in this district will be dependent on the provision of public or community water and sewer facilities. Although areas may be served with such utilities, most of these areas are located beyond existing or anticipated

utility service coverage areas. The minimum lot size for residential uses in this district is therefore larger than in other residential zoning districts.

B. R-2 SINGLE FAMILY MODERATE

The purpose of this district is to accommodate single family site built and modular construction and double-wide manufactured home placement. The minimum lot size allowed in this district will be dependent on the provision of public or community water and sewer facilities. Although areas may be served with such utilities, most of these areas are located beyond existing or anticipated utility service coverage areas. The minimum lot size for residential uses in this district is therefore larger than in other residential zoning districts.

C. R-3 SINGLE FAMILY GENERAL

The purpose of this district is to accommodate single family site built and modular construction and double-wide and single-wide manufactured home placement. The minimum lot size allowed in this district will be dependent on the provision of public or community water and sewer facilities. Although areas may be served with such utilities, most of these areas are located beyond existing or anticipated utility service coverage areas. The minimum lot size for residential uses in this district is therefore larger than in other residential zoning districts.

D. RS-8 SINGLE FAMILY 8,000 SQUARE FEET

The purpose of the RS-8 District is primarily for the development of single family residential with a standard minimum lot size of eight thousand (8,000) square feet. This district is generally found in the Urban Standards Overlay (USO) district and is served by public or community water and sewer utilities. Higher densities than this is normally allowed and a variety of different residential types may be accommodated through Planned Residential Developments (PRD), Infill Residential Developments and Traditional Neighborhood Developments (TND) and / or through the satisfaction of certain performance design and construction.

E. RS-12 SINGLE FAMILY 12,000 SQUARE FEET

The purpose of the RS-12 District is primarily for the development of single family residential with a standard minimum lot size of twelve thousand (12,000) square feet. This district is generally found in the Urban Standards Overlay (USO) district and is served by public or community water and sewer utility. Higher densities than this is normally allowed and a variety of different residential types may be accommodated through Planned Residential Developments (PRD), Infill Residential Developments and Traditional Neighborhood Developments (TND) and / or through the satisfaction of certain performance design and construction.

F. RS-20 SINGLE FAMILY 20,000 SQUARE FEET

The purpose of the RS-20 District is primarily for the development of single family residential with a standard minimum lot size of twenty thousand (20,000) square feet. This district is generally found in the Urban Standards Overlay (USO) district and is served by at least one (1) public or community water or sewer utility. Higher densities

than this is normally allowed and a variety of different residential types may be accommodated through Planned Residential Developments (PRD), Infill Residential Developments and Traditional Neighborhood Developments (TND) and / or through the satisfaction of certain performance design and construction.

G. RMF RESIDENTIAL MULTI FAMILY

The purpose of this district is intended primarily as a residential district for the location of single family, two family and multi-family dwellings along with their customary accessory uses so as to establish areas where development patterns are somewhat denser than surrounding areas. In order to ensure that developments are well planned and compatible with adjoining residential uses, density levels of development in excess of six (6) units per acre are allowed subject to the issuance of a Conditional Use Permit (CUP) by the Board of Adjustment. This district should have access to public or community water and sewer utilities.

H. RLD RESIDENTIAL LOW DENSITY

The RLD requires the largest standard minimum lot size of two (2) acres (87,210 square feet) and the purpose of the district is designed to accommodate residential uses in the most rural portions of the County or to protect areas from large-scale residential development where industrial or intense commercial development is called for on the land development plan in the future, but where specific development plans do not currently exist. The district may be located both within and beyond the Urban Standards Overlay (USO) District.

6.2.2 OFFICE DISTRICTS

A. TMU TRANSITIONAL MIXED USE

The TMU district encourages office and mixed office and residential uses at an intensity to compliment nearby residential land uses. Such areas are most often found in developed, urban portions of the County within the Urban Standards Overlay District. Many such areas, especially those found along major corridors, were originally developed for residential areas. But due to their location, the blending of office uses and higher density residential development has taken place. The TMU district is designed to encourage such mixed development to continue.

B. OLC OFFICE / LIGHT COMMERCIAL

The OLC district also allows for and is designed to accommodate mixed office, retail, and residential development. Such higher intensity development will most likely occur within the Urban Standards Overlay District where public utilities may present and where access to major thoroughfares and/or transit is found. Development in OLC areas will most likely be at a higher intensity level than in the TMU district.

C. O-1 OFFICE

The O-1 district accommodates larger-scale office developments along with complementary commercial service establishments.

D. OM MEDICAL OFFICE

The OM district is designed to accommodate medically oriented uses that lie in close proximity to Gaston Memorial Hospital or other existing or planned community medical facilities in the County. In order to serve the general public better, complementary uses (doctors' offices, medical supply shops, pharmacies, etc.) are encouraged to locate near these medical facilities. Uses that are non-medically related are generally excluded for this zoning district so as to not compete for space that could otherwise be developed for medically related uses. Given the relatively small amount of land suitable for such zoning, uses which predominate in other zoning districts (i.e., residences, non-medically related retail uses) are not allowed in the O-M district.

6.2.3 COMMERCIAL DISTRICTS

A. CBD CENTRAL BUSINESS DISTRICT

The CBD district is designed to accommodate the uses found in a central city location and to encourage high intensity, compact, urban development in a pedestrian-oriented setting. Retail, office, personal service, and institutional uses normally found in a central business district are allowed. In order to encourage more efficient building usage and to take advantage of the area's centralized location, second-story residential uses are permitted, as are high-density residential developments. Signage requirements shall be specifically tailored for a downtown setting.

B. UMU URBAN MIXED USE

The UMU district is generally located in the fringes of central business districts and is designed to allow for the redevelopment of older commercial districts in a pedestrian-friendly manner. An UMU zoned area may not represent the true downtown business core of a community, but contains development features (i.e., limited or no front yard setbacks, limited amounts of off-street parking) that often pre-date the implementation of land use regulations. Redevelopment of such areas, for both commercial and residential purposes, is encouraged.

C. C-1 LIGHT COMMERCIAL

The C-1 Light Commercial District is designed to accommodate a large variety of retail uses designed to meet the needs of individual neighborhoods, or other relatively small geographic areas. Stores and shopping complexes are therefore relatively small in size and are designed to be compatible and integrated with adjoining residential neighborhoods. This zoning district is not intended to accommodate retail uses which attract persons from outside the neighborhood or which attract large numbers of passing motorists.

D. C-2 HIGHWAY COMMERCIAL

The C-2 Highway Commercial District is primarily intended to accommodate those retail service and distributive uses that are typically located along or adjacent to principal or minor arterials and which require high visibility, good road access, and which cater primarily to passing motorists. Development in this district is designed to promote aesthetics and the safe and efficient movement of traffic so as to not unduly

burden adjacent thoroughfares. As larger and/or more intensive developments normally will create more significant impacts on adjoining neighborhoods and road and utility infrastructures, larger developments may be allowed in this zoning district. Most C-2 zoning districts will be located within the Urban Standards Overlay District.

E. C-3 GENERAL COMMERCIAL

The C-3 District is intended to accommodate the broadest array of commercial uses of all the commercial zoning districts, some of which are not allowed in any of the other commercial zoning districts. Like the C-2 district, the C-3 district is intended to accommodate the community's larger and most intense commercial developments (outside of the central business district) and is generally located within the Urban Standards Overlay District.

F. NBS NEIGHBORHOOD BUSINESS SERVICES

The NBS District is designed primarily for local retail, offices, and personal services developed at relatively low intensity levels and which serve and are compatible with adjoining residential neighborhoods. It is not intended to accommodate retail uses which are designed to attract persons from outside the neighborhood or which attract large numbers of traveling motorists. Accordingly, regulations for this district are designed to encourage the development of small, neighborhood-oriented retail areas.

G. CCX CATAWBA CROSSING INTERCHANGE

The CCX district is intended to accommodate an array of aesthetically pleasing and well-designed developments that are located in close proximity to interchanges located along the Catawba Crossing. While developments in closest proximity to the interchange exits may be designed for automobile access and to provide amenities to motorists using the Catawba Crossing, the district is intended to also accommodate mixed residential, retail, service and office uses that are well-integrated, compact, and pedestrian friendly. This district is not intended to accommodate nor promote typical "strip commercial" development so often found along roads that emanate from limited access road interchanges.

As indicated in Table 7.1-1, a wide variety of residential, retail, service, and office uses are allowed within the CCX district. It is the intention of this district to promote well-designed development which integrates a variety of uses. Thus, lot by lot incremental development of parcels within an individual CCX zoning district is NOT recommended. Planned developments such as PRDs (Planned Residential Developments), TNDs (Traditional Neighborhood Developments), and PUDs (Planned Unit Developments) are strongly encouraged. Individual uses outside of these developments are limited to the following:

- 1. Single Family Dwellings
- 2. Convenience Stores
- 3. Hotels / Motels
- 4. Restaurants without drive-through facilities
- 5. Essential Services, Classes 1, 2, and 4

With the exception of Single Family Dwellings and Essential Services, all of the other uses listed above shall be subject to the issuance of a Conditional Use Permit.

Uses that existed at the time CCX zoning was placed on a piece of individual use (i.e., a use shown above, or as a use within a PRD, TND, or PUD). Any expansion of such a conforming use will be subject to the issuance of a conditional use permit per Section 5.11 of this Ordinance. Other uses not specifically listed in Table 7.1-1 as being allowed in the CCX district or otherwise allowed as part of a PRD, TND or PUD shall be considered "non-conforming" and shall be subject to the provisions of Section 3.5.

6.2.4 INDUSTRIAL DISTRICTS

A. I-1 LIGHT INDUSTRIAL

The I-1 district is established to provide for areas that contain a mix of light manufacturing uses, office park and service uses in an attractive setting with proper screening and buffering. I-1 districts should include areas that continue the orderly development and concentration of light industrial uses. Any areas rezoned to the I-1 district subsequent to the adoption of this Ordinance should be located so as to have direct access to or lie within close proximity of a principal or minor arterial.

B. I-2 GENERAL INDUSTRIAL

The I-2 district is established to provide for areas of heavier manufacturing and industrial uses that are properly sited, based on such factors as: adjacent land uses, access to the transportation network, and the availability of public services and facilities. It is the intent of this district to provide an environment for industries that is unencumbered by nearby residential or commercial development. I-2 zoned districts shall be located in areas where conflicts with other uses can be minimized to promote orderly transitions and buffers between uses. The I-2 district is established in order to provide sites for activities that involve major transportation terminals, and manufacturing facilities that have a greater impact on the surrounding area than industries found in the I-1 district. I-2 districts shall generally not be located adjacent to any property that is zoned for residential use, except when mitigating factors (i.e., terrain, buffering, and transportation access) are in place to substantively mitigate any potential negative impacts upon such residential areas caused by uses in the I-2 district. Any areas that are rezoned to an I-2 district subsequent to the adoption of this Ordinance shall be located so as to have direct access to or lie in close proximity of a principal or minor arterial.

C. I-3 EXCLUSIVE INDUSTRIAL

The I-3 district is established to provide areas for the most intensive heavy manufacturing and industrial uses that may have impacts such as excess noise, environmental concerns, and extended hours of operation. Uses in this district are extremely limited and include mining uses, petroleum refining and slaughterhouses. I-3 districts shall not be located adjacent to any property that is zoned for residential use. Any areas that are rezoned to an I-3 district subsequent to the adoption of this Ordinance

shall be located so as to have direct access to or lie in close proximity of a principal or minor arterial.

D. I-U URBAN INDUSTRIAL

The I-U urban industrial district is normally found in older portions of the community that were developed prior to the advent of zoning regulations and which contain older industrial and warehouse-type uses. Such uses often times do not conform to the parking, bulk or setback requirements that would be applicable if those structures were developed today. The purpose of this district is to accommodate such existing uses and to encourage the redevelopment of such uses for industrial, commercial and/or residential purposes.

SECTION 6.3 OVERLAY ZONING DISTRICTS

6.3.1 FH FLOOD HAZARD OVERLAY DISTRICT

It is the purpose of this zoning district to promote public health, safety, and general welfare and to minimize public and private losses due to flood conditions within flood prone areas.

See Chapter 16 for the Flood Hazard Regulations.

6.3.2 WS WATER SUPPLY WATERSHED OVERLAY DISTRICT

The regulations herein are designed to protect the water quality of the streams in the water supply watershed that lie within the jurisdiction of this Ordinance. It is the intent of this Ordinance to provide regulations that implement the rules adopted by the North Carolina Division of Water Quality, pursuant to NC General Statute 143-214.5.

See Chapter 15 for the Water Supply Watershed Regulations.

6.3.3 RESERVED

6.3.4 SV SCENIC VIEW OVERLAY DISTRICT

The purpose of the SV District is to protect the scenic views from within the Daniel Stowe Botanical Garden. Gaston County hereby finds that the Daniel Stowe Botanical Garden has become a major asset to economic development, tourism, recreation, and natural resource conservation for Gaston County and the surrounding region. In order to preserve and enhance the natural scenery fostered by the Botanical Garden and enjoyed by visitors to the Garden, Gaston County finds it necessary to control the height of structures within the view from the Garden. Gaston County also finds that the erection of tall structures in areas within view of the Botanical Garden can result in the degradation of its natural scenic views and thus reduce its attraction as a natural scenic area and a retreat from urban development.

6.3.5 TH THOROUGHFARE HIGHWAY OVERLAY DISTRICT

The TH district has been created to ensure that development that takes place along designated thoroughfares be well planned. At some point in the future, widening or construction of these roads will take place. In order to minimize any negative impacts to adjoining property owners occurring as a result of such widening projects, the TH district has been created to require that

all new structures lying on properties along these roads be adequately set back from existing and/or projected road rights-of-way. In this manner, all structures built per the TH district requirements will be adequately set back from the road when it is widened. The thoroughfare roads are shown on the adopted Thoroughfare Map, not the official Zoning Map. This thoroughfare is addressed when a development is submitted for review.

6.3.6 USO URBAN STANDARDS OVERLAY DISTRICT

Areas of the County which are located outside their corporate limits and /or municipal Extra Territorial Jurisdiction (ETJ) but where the provision of public water and sewer services can reasonably be expected to occur over the next 10-15 years, have been designated as the "Urban Standards Overlay District".

Accordingly, standards for development, more akin to those that traditionally are found in urban areas, as opposed to rural areas, are called for. Standards addressed, but not limited to: building design, off-street parking, road, lot and subdivision standards.

Note: If any portion of the subject property is within the USO, then the entire property shall be developed in accordance with USO standards.

6.3.7 RESERVED

6.3.8 WF WATERFRONT OVERLAY DISTRICT

The Waterfront District is hereby established to provide supplemental restrictions to protect and enhance water quality, public safety, and public recreational opportunities on the Catawba River and its impoundments. This District shall cover the surface waters of the Catawba River and its impoundments and all land areas within one thousand (1000) feet of these shorelines. The shoreline shall be deemed to be the mean high water mark (i.e., the 570-foot contour level for Lake Wylie) of the Catawba River and said impoundments.

6.3.9 RESERVED

6.3.10 SH SPECIAL HIGHWAY OVERLAY DISTRICT

The purpose of this district is to protect and preserve the landscape of areas which lie adjacent to designated Special Highways and that development that takes place on land that lies near such highways occur in a manner which maximizes the aesthetics and development potential of the area through the application of additional development standards. The SH District shall consist of all lots fronting on the special highway for a depth of five hundred (500) feet as measured from the centerline of the special highway (for a total width of one thousand (1,000) feet), unless otherwise indicated on the Zoning Map.

6.3.11 CH Corridor Highway Overlay District

The purpose of the CH District is to preserve and enhance the streetscape along designated corridor highways in Gaston County. A CH District may exist along the entire length of a roadway or along any identifiable segment of a roadway. Any CH District initially established shall contain a minimum length of at least one thousand (1,000) linear feet as measured along one side of a designated corridor highway. The CH District shall consist of all lots fronting on

the corridor highway for a depth of two hundred-fifty (250) feet as measured from the centerline of the corridor highway (for a total width of five hundred (500) feet), unless otherwise indicated on the Zoning Map. Although such corridor highways may vary in character, particular aspects of development along those roads raise common concerns and should be managed in a consistent way in order to preserve and enhance the streetscape.

6.3.12 CC CATAWBA CROSSING OVERLAY DISTRICT

The purpose of the CC Overlay district is to maintain an aesthetic view shed for motorists and landowners along the length of the Catawba Crossing. Any CC Overlay district initially established shall generally contain a minimum depth of at least one thousand (1,000) linear feet and shall consist of all lots fronting along the Catawba Crossing for a depth of five hundred (500) feet on each side of the Catawba Crossing as measured from the centerline of the Catawba Crossing. The Board of Commissioners shall have the authority to modify the initial or subsequent placement of the CC Overlay district boundaries on a case-by-case basis where deemed to be in the County's best interest.

SECTION 6.4 PARALLEL CONDITIONAL ZONING (PCUP) DISTRICTS

Parallel conditional use districts are established to consider situations where a particular use may be acceptable on a lot or tract of land but the other uses permitted in a general zoning district would not be acceptable. In such instances, the Board of Commissioners may elect to rezone the lot(s) in question to a Parallel Conditional Use district. Such rezoning may be made contingent upon the property owner meeting fair and reasonable conditions, associated with the issuance of a conditional use permit, that ensure the compatibility of the use with surrounding properties and promote the general welfare of the community. Zoning to a PCUP district shall be a voluntary procedure on the part of the property owner or his agent, and is intended for firm development proposals. It is not intended for securing early zoning for tentative proposals. The process for securing a PCUP zoning district designation along with a conditional use permit is explained in Section 5.16.4.

The following PCUP districts are hereby established:

| 1. | CU / R-1 | 9. | CU / TMU | 17. | CU / C-3 |
|----|------------|-----|----------|-----|----------|
| 2. | CU / R-2 | 10. | CU / OLC | 18. | CU / NBS |
| 3. | CU / R-3 | 11. | CU / O-1 | 19. | CU / I-1 |
| 4. | CU / RLD | 12. | CU / OM | 20. | CU / CCX |
| 5. | CU / RS-20 | 13. | CU / CBD | 21. | CU / I-2 |
| 6. | CU / RS-12 | 14. | CU / UMU | 22. | CU / I-3 |
| 7. | CU / RS-8 | 15. | CU / C-1 | 23. | CU / IU |
| 8. | CU / RMF | 16. | CU / C-2 | | |

SECTION 6.5 CONDITIONAL ZONING (CD) DISTRICTS

The Conditional Zoning (CD) District process allows for the establishment of certain uses that, because of their nature or scale, have particular impacts on both the immediate area and the community as a whole. The development of these uses cannot be predetermined or controlled by general district standards. In order to accommodate these uses, this Section establishes the conditional zoning district process. The process for approval of a CD Zoning District is explained in Section 5.16.5. The rezoning of any parcel of land to a CD district shall be a

voluntary process initiated by the property owner or his authorized agent. Any area rezoned to a CD district shall be in general compliance with the goals, objectives, and implementation strategies of the adopted Comprehensive or Land Use Plan and all other plans and regulations officially adopted by the Board of Commissioners. The review process established in this Section provides for the accommodation of such uses by a reclassification of property into a CD district, subject to specific conditions (which may exceed those that would otherwise be required for the use in question), which ensure compatibility of the use with the enjoyment of neighboring properties and in accordance with the general plans of development of the County. A conditional zoning district is not intended for securing early zoning for a proposal.

Once a property has been rezoned to a CD district, it shall be referenced with the letters "CD" in front of the name of the applicable general zoning district listed in Section 6.2. Thus, a property rezoned to a C-2 Conditional District shall appear on the Zoning Map as "CD / C-2".

For zoning district details of the various municipalities within Gaston County, refer to the zoning ordinances for each town or city. Some variations among district code definitions for the municipalities do exist. Any displayed zoning codes of the Gaston County Tax Department real property data should confirm active zoning with the applicable authority within the appropriate jurisdiction. Records of the Gaston County Tax Department should not be considered a definitive source of information regarding current zoning for either Gaston County or the various municipalities within Gaston County. For Gaston County zoning issues, refer to the Gaston County Unified Development Ordinance (UDO).

The Zoning Codes and Districts listed for the municipalities within Gaston County may change at any time as is deemed necessary by the appropriate zoning authority for those jurisdictions.

WEIGHTS AND MEASURES

Tables of Weights and Measures and Other Information That May Be Helpful to the Assessor/Appraiser.

| Metric Measure | | |

| 1 Cubic Foot | = | 1,728 cubic inches-7,481 gallons |
| 1 Cubic Yard | = | 27 cubic feet |
| 1 Cord Foot | = | 16 cubic feet |
| 1 Cord of Wood | = | 8 cord-128 cubic feet |
| 1 Perch of Masonry | = | 24 ³ / ₄ cubic feet |
| 1 Bushel | = | 1.2445 cubic feet |

Angles And Arcs Measure

| 1 Minute | = | 60 seconds |
|-----------------|---|--|
| 1 Degree | = | 60 minutes |
| 1 Right Angle | = | 90 degrees-1 quadrant |
| 1 Circumference | = | 360 degrees-4 quadrants |
| Board Measure | | |
| 1 Board Foot | = | Length in feet x width in feet x thickness in inches |

| Measurement in Gene | ral Use | |
|---------------------|---------|--|
| 1 Link | = | 7.92 inches |
| 1 foot | = | 12 inches |
| 1 yard | = | 3 feet or 36 inches |
| 1 rod | = | 16½ feet, 5½ yards or 25 links |
| 1 surveyor's chain | = | 66 feet, or 4 rods, or 100 links |
| 1 furlong | = | 660 feet, or 40 rods |
| 1 mile | = | 8 furlongs, 320 rods, 80 chains, or 5,280 feet |
| 1 square rod | = | 2721/4 square feet or 301/4 square yards |
| 1 acre contains | = | 43,560 square feet |
| 1 acre contains | = | 160 square rods |
| 1 span | = | 9 inches |
| 1 hand | = | (horse measurement) 4 inches |
| 1 knot | = | (nautical) 6,080.27 feet |
| 1 fathom | = | (nautical) 6 feet |
| 1 stone | = | 14 pounds |
| 1 square acre | = | Approximately 208.7 feet on each side |
| 1 acre | = | Approx 8 rods by 20 rods, or any two combinations or rods whose product is 160 |

SIMPLE FORMULA CONVERTING SQUARE FEET TO ACRES

Multiply by 23 and point off 6 places (This method is not exact but is useful for rough calculations) Example: 1500 feet x 2050 feet = 3,075,000 square feet x 23 = 70.73 acres

BOARD MEASURE

Multiply thickness in inches by width in inches, divide product by 12 and multiply result by the length in feet. The result is board measure content.

Conversion factors for converting lineal feet of lumber into board feet.

Example: 50 –2 inches x 10 inches 20 feet long

 $50 \times 20 \text{ feet} = 1000 \text{ lineal feet}$

2 inches x 10 inches = 20 square inches divided by 12 = 1.667 board feet x 1000 lineal feet equals 1,667 board feet

Table for the Conversion of Lineal Feet into Board Feet

| 2 inches x 4 inches | (1 lineal foot) | .667 board feet |
|-----------------------|-----------------|-------------------|
| 3 inches x 4 inches | (1 lineal foot) | 1.000 board feet |
| 2 inches x 6 inches | (1 lineal foot) | 1.000 board feet |
| 2 inches x 8 inches | (1 lineal foot) | 1.333 board feet |
| 2 inches x 10 inches | (1 lineal foot) | 1.667 board feet |
| 2 inches x 12 inches | (1 lineal foot) | 2.000 board feet |
| 2 inches x 14 inches | (1 lineal foot) | 2.333 board feet |
| 2 inches x 16 inches | (1 lineal foot) | 2.667 board feet |
| 3 inches x 6 inches | (1 lineal foot) | 1.500 board feet |
| 4 inches x 6 inches | (1 lineal foot) | 2.000 board feet |
| 4 inches x 8 inches | (1 lineal foot) | 2.667 board feet |
| 4 inches x 10 inches | (1 lineal foot) | 3.333 board feet |
| 4 inches x 12 inches | (1 lineal foot) | 4.000 board feet |
| 6 inches x 6 inches | (1 lineal foot) | 3.000 board feet |
| 6 inches x 8 inches | (1 lineal foot) | 4.000 board feet |
| 10 inches x 12 inches | (1 lineal foot) | 10.000 board feet |
| 12 inches x 12 inches | (1 lineal foot) | 12.000 board feet |

PRINCIPLES

PLANE FIGURE -A plane surface bounded by either straight or curved lines and having no thickness.

SOLID – A body, such as a barrel, building, etc.

SQUARE MEASURE - Area calculation requiring only two dimensions, length, and width.

CUBIC MEASURE – Cubic or cubage means volume and gives size in terms of its bulk. Calculation requires 3 dimensions, length x width x depth or height or thickness

MEASURES AND THEIR EQUIVALENTS

A gallon of water (U.S. Standard) weighs 8 1/3 pounds and contains 231 cubic inches.

A cubic foot of water contains 7½ gallons, 1,728 cubic inches and weighs 62½ pounds.

Doubling the diameter of a pipe increases its capacity four times.

To find the pressure in pounds per square inch of a column of water, multiply the height of the column in feet by .434.

To find the capacity of tanks any size, given the dimensions of a cylinder in inches, to find its capacity in U.S. gallons: square the diameter, multiply by the length and by .0034 (Note: See table of tank capacities.)

Rectangular tanks multiply the length by the width by the depth (All in inches) and divide the result by 231. The answer is the capacity in gallons.

31½ gallons equals one barrel.

B.T.U. (British Thermal Unit) is the amount of the heat required to raise one pound of water one degree Fahrenheit.

A ton of refrigeration is measured by the displacement of the amount of heat required to melt a ton of ice in 24 hours. One motor horsepower of an electrically powered unit is normally required to produce one ton of refrigeration. 12,000 B.T.U. equals one tone.

Kilowatts multiplied by 1.3405 equal horsepower.

WEIGHTS & MEASURES

| 1 cubic inch of Cast Iron weighs | 0.26 pounds |
|----------------------------------|----------------------|
| 1 cubic inch Wrought Iron weighs | 0.28 pounds |
| 1 cubic inch Water weighs | 0.036 pounds |
| 1 inch of Water weighs | 62.321 pounds |
| 1 United States gallon weighs | 8.33 pounds |
| 1 Imperial gallon weighs | 10.00 pounds |
| 1 United States gallon equals | 231.01 cubic inches |
| 1 Imperial gallon equals | 277.274 cubic inches |
| 1 cubic foot of Water equals | 7.48 U.S. gallons |
| 1 gallon of water weighs | 8.34 pounds |
| 1 gallon equals | .1337 cubic feet |
| 1 gallon equals | .1074 bushels |
| 1 cubic foot equals | .8032 bushels |
| 1 barrel (oil) equals | 42 gallons |
| 1 barrel (water) equals | 31.5 gallons |

Pressure in pounds per square inch of column of water equals .434 times the height of the column in feet.

AREAS

Square foot area of surface equals square of one side multiplied by factors shown.

| Regular Shaped | Number of Sides | Factor |
|----------------------|-----------------|--------|

To find the capacity in barrels (oil) =Diameter squared x height.

To find the capacity in gallons = Diameter squared x 5.8748 x height (Diameter & height in feet).

AREAS AND MEASUREMENTS

To find the circumference of a circle, multiply the diameter by 3.1416.

To find the diameter, multiply circumference by 0.3183 or divide circumference by 3.1416.

To find the radius, multiply circumference by 0.15915.

To find the side of an inscribed square, multiply the diameter by 0.07071 or multiply the circumference by 0.2551.

To find the side of an equal square, multiply the diameter by 0.8863 or multiply the circumference by 0.2821.

Square: A side multiplied by 1.1142 equals the diameter of its circumscribing circle.

A side multiplied by 4.443 equals the circumference of its circumscribing circle.

A side multiplied by 1.126 equals the diameter of an equal circle.

A side multiplied by 3.547 equals circumference of an equal circle.

To find the area of a circle, multiply the circumference by one-quarter of the diameter or multiply the square of the diameter by 0.7854 or multiply the square of the circumference by 0.07958 or multiply the square of one-half of the diameter by 3.1416.

To find the surface of a sphere or globe, multiply the diameter by the circumference or multiply the square of the diameter by 3.1416 or multiply four times the square of the radius by 3.1416.

To find tank capacities, diameter square $\times .0034 = \text{gallons per inch of height} - \text{Base } 42 \text{ gallons per barrel}.$

To find area of a triangle – multiply base by ½ perpendicular height.

To find area of an ellipse – product of both diameters x .7854.

To find area of a parallelogram – base x altitude.

To find cu. inches in a ball – multiply cube of diameter by .5236.

To find cubic contents of a cone – multiply area of base by one-third the altitude.

Area of rectangle equals length multiplied by width.

Surface of frustum of cone or pyramid equals sum of circumference of both ends x $\frac{1}{2}$ slant height plus area both ends.

Contents of frustum of cone or pyramid: multiply area of two ends and get square root – add the two areas and time 1/3 altitude.

CONVERSION TABLES

To convert bushels to ton, multiply number of bushels by 60 and divide the product by 2000 (average maximum weight of commodities 60 pounds per bushel.)

To convert gallons to bushes, divide gallons by 9.35. Answer in bushels.

To convert cubic measure into bushels, multiply by 0.8035.

To find capacity of cylindrical tanks standing on end: To find the capacity in cubic feet of a round tank or cistern, multiply the square of the average diameter by the depth and multiply the product by .785.

CONSTRUCTION COMPONENTS

DESIGN

One of the most significant factors influencing quality classification and cost of Construction is design. The design of a house relates not only to the degree of functional efficiency attained in layout, but also to its overall appearance. In this sense, appearance means the refinement of exterior elevations, interior finish, and perimeter shape. The degree of refinement is usually evident in the complexity of foundation and roof outlines, plus the elaborateness of finishing materials and attention given to details.

Lower quality houses will generally be simple rectangular shaped structures with straight lines on all four walls, and a higher ratio of floor area per lineal foot of exterior wall. Higher quality structures will generally have an irregular foundation outline and a lower ratio of floor area per lineal foot of exterior wall. In other words, the design of a higher quality house substitute's esthetics for efficiency (economy of construction), but does not sacrifice functional utility. In fact, the integration of areas given to living, dining, food preparation, sleeping, hygiene and storage into a functional or logical whole can best be accomplished when design is not restricted by a rectangular or "boxed" perimeter shape.

An irregular perimeter or foundation outline generally denotes higher quality construction because replacement cost is increased by a greater amount of exterior wall area plus special floor and roof framing.

ELECTRICAL

In new construction, the typical electrical service consists of 120-240 volt, 3 wire, 200 amp circuit breaker systems for houses with electric heat and 150 amp services for houses with gas heat. Minimum Property Standards require one wall switch per room with a minimum of 6' between convenience outlets. 220 volt service is required for electric ranges and clothes dryers, whereas 110 volt service is required for convenience outlets. The majority of residential wiring is done with Romex, a non-metallic sheathed cable. More expensive homes have BX or steel armored cable. Conduit wiring is seldom found in residential construction. Older homes may be wired with Knob & Tube or porcelain insulators. Houses with old style fuse boxes, Knob & Tube wiring, or 60 amp service are generally of low quality or will soon need rewiring.

EXTERIOR WALLS

Exterior wall construction represents one of the most significant components of a residential building. It normally accounts for 25% to 35% of replacement cost new and consists of (1) The Basic Structure – wood framed houses usually have 2" X 4" studs placed directly over floor joists on 16" centers - a 2" X 4"sole plate secures the studs at floor level and a 4" X 4" ceiling plate ties the studs together at the ceiling line (2) Exterior Finish- consists of sheathing, the visible exterior wall cover, trim and painting. The materials used in the basic structure and exterior wall finish will determine the type of construction, i.e., wood framed - brick veneer, etc. (3) Interior Facing& Finish - new construction is generally 1/2" to 5/8" dry wall, taped & painted; older houses may have lath and plaster; 2" to 3 1/2" batt insulation is normally placed between the studs behind the drywall. (4) Window & Door Openings - the size and number of openings will have a significant influence on replacement cost.

FLOOR STRUCTURE & FINISH

Conventional wood floor construction consists of the sill plates, girders, floor joists, bridging, sub floor and finished flooring. The sill plate is the first wood member of a frame structure and is usually a horizontally laid 2" X 6" board secured to the foundation by 1/2" X 16" anchor bolts. A girder is the main horizontal interior supporting member of the floor structure. It may be steel or wood, but a 3-ply 2" X 10" frame girder is typical. Minimum Property Standards call for no less than 2" X 8" floor joists on 16" centers with a maximum span of 13½" and 2" X 10" floor joists on 16" centers if span is between 13½" and 16". Better quality construction will have 1" X 3" cross bridging every 8' to 10' span. However, 2" X 6", or 2" X 8" block-bridging is typical of fair and average quality construction. Diagonally laid 1" X 5 " tongue & groove boards are found in some older homes and in high quality new construction. Basically, the finished flooring of a house will be either pine or hardwood. Generally, the kitchen will have an inlaid linoleum cover and the bath will have ceramic or vinyl tile. Wall to wall carpets may be laid over a hardwood finished floor or over 5/8" pressboard (particleboard).

FOUNDATION

The foundation of a residence with conventional wood floor construction consists of the footings, foundation wall and interior piers. A solid perimeter foundation wall is generally constructed with 8" concrete blocks; brick-to grade construction has 12" blocks to grade level with the balance being 8" block allowing a 4" brick to rest on the outer edge of the 12" block. Interior piers are generally of the same materials as the foundation wall. Footings are poured concrete and must be a minimum of 8" deep and 3" wider (on each side) than the foundation wall.

With concrete slab floor construction, the floor, foundation walls and footings are poured monolithically. In such case, there are no framing members for the floor structure.

Obviously, the footings and lower levels of the foundation wall cannot be seen. Therefore, unless you are informed of structural weakness or see evidence of excessive settlement, you must assume that the foundation has been properly constructed.

HEATING

The type and adequacy of the heating system is not only a cost important factor, but also one which has a significant influence on the functional utility and value of a building. There are several types and variations of heating systems used depending on location and availability of fuel. The systems described here are those most frequently encountered.

Floor Furnace - may be oil or gas fired. This type heating system is normally found in lower quality one story houses with crawl space. There is no duct work, and circulation is by gravity. The unit is generally placed near the center of the house. Its capacity is rated from 30,000 to 50,000 BTU.

Gravity Furnace - This system is generally found in the basements of older houses, since it must be below the level of the rooms to be heated. Coal, either stoker or hand-fired, was the main source of fuel. However, many systems still in use have been converted to oil or gas. Heat is provided as the air comes in contact with heated surfaces in the furnace. The warm air rises and flows through inclined leader pipes to supply registers usually installed in the floor or baseboard adjacent to the outside walls of the various rooms. The cooler air is drawn down through large return-air-intakes located in the floor near an outside wall to the bottom of the furnace casing for re-heating. The duct work for a gravity warm-air heating system is quite large and must be slanted in such a way as to permit the natural flow of warm and cool air. This significantly reduces the amount of useable head room in the basement. The gravity warm-air heating system is relatively inexpensive and lacks functional utility when compared to more modern systems. The cost of this type system generally ranges from 15% to 20% less than a forced warm-air system with a comparable BTU rating.

Forced Warm Air - May be electric, oil or gas fired. Air is warmed by heated surfaces in the furnace and then distributed to the various rooms through supply ducts by a blower (fan) in the furnace. The blower also draws the room air back to the furnace through return-air intakes which are usually located at the baseboard of inside walls. Adjustable registers or diffusers for the warm air are generally located on the outside wall at the floor level (baseboard), preferably below windows. This system requires less space for

the furnace and ducts than the gravity system, and it does not need to be centrally located or below the level of the heated area.

Electrical Wall Heaters - This system follows the same principle as electric ceiling heat, but is substantially cheaper, and concentrates all heat from one point in the room. Its size is also measured in wattage per coil or unit stack. The typical unit will range from 1500 watts up to 4000 watts.

Electric Baseboard Heat - This is merely a modification of the electric wall heater. However, it distributes the heat over a somewhat wider area, and costs approximately 20% more than electric wall heaters of the same wattage.

Hot-Water (Gravity System) - may be coal, oil or gas fired. In this system, hot water serves as the medium for carrying heat to all parts of the building. Circulation in a gravity system is created when the hot water ascends through the flow pipe and then flows down through return pipes which pass successively through radiators on the various floors of the building. Since heat is released as the water passes through each radiator, the ones on the lower floors must be larger. The "two-pipe" system relieves this problem since each radiator has its own individual hot-water feed. A hot water system for residential use is rather uncommon due to the cost of the system (which may run from 40% to 60% more than forced warm-air or radiant ceiling systems) and the bulkiness of the materials.

Steam Heating - Maybe coal, oil or gas fired. In this type system, water in the boiler is converted to steam which rises through the main distribution pipe. From this pipe, the steam moves into the radiators, gives off its heat and condenses. The condensed steam (water) then flows back to the boiler for reheating. In the "two-pipe", the steam and the condensate flow in separate pipes. With the two – pipe system, the steam always enters the radiators from the top and subsequently emerges as condensate from the bottom. If the return-flow pipe is situated below the water level of the boiler, it is described as a "wet" condensate return, whereas if it is above the water level, it is a "dry" condensate return. In a single pipe system, the steam and condensate flow in the same pipe and must enter the bottom of the radiator. As with the hot-water system, steam heating is expensive and somewhat cumbersome.

INTERIOR FINISH

Interior construction and finish, as a whole, can account for 10% to 30% of replacement cost new, depending on the elaborateness of trim, number and sizes of closets, kitchen cabinets, special wall finishes, etc.

Interior partitions are generally wood framed with 2" X 4" studs on 16" centers. The most common basic interior facing is 1/2" or 5/8" drywall, taped and painted. Older houses often have walls and ceilings finished with plaster on wood or gypsum lath. However, due to the wide use and acceptance of drywall in most quality levels, plaster does not necessarily increase value in proportion to cost. The exception occurs in the luxury or mansion type house where plaster is consistent in cost and quality with the entire structure.

The type and quality of materials available for finishing the interior of a house varies greatly. However, the basic wall and ceiling finish will generally conform to the grade of materials and quality of workmanship evidenced by exterior wall finish and design. Special attention should be given to the amount and quality of kitchen cabinets, closets, and the finish of special areas such as the bath and den.

MECHANICAL - CENTRAL AIR CONDITIONING

The majority of residential central air-conditioning is done with either "split" refrigerated systems, ranging from one to five ton capacity. The combination heating/cooling or package unit utilizes the same duct work with gas heating and electric cooling. This is a central system for original construction and generally results in some savings (per system capacity) in construction costs.

The split system is usually added to an existing forced warm-air furnace. The fan coil is normally installed in the top of the furnace and the condensing unit (with compressor and condenser in the same cabinet) is located outside the house. The efficiency of this system is equal to that of the package system, although cost may be somewhat higher if it is added after original construction.

The heat-pump is an electric powered combination heating and cooling unit which consists of a compressor, condenser, throttle valve and evaporator. It operates on the principle that fluids under high pressure evaporate at a higher temperature than fluids under low pressure. The heat transfer medium is heated under low pressure in the evaporator then transferred by the compressor to the high pressure condenser where the heat is given off and blown through a duct system in the house. The cooling system is activated by thermostatically reversing a four-way valve which reverses the cycle of the unit. The heat pump is somewhat more expensive than the comparable gas-electric

package unit described above, and generally requires electric resistance heaters to provide supplementary heat during periods when the temperature drops below 25°F.

The variation in models, sizes and capacities of central air-conditioning systems is virtually boundless. The only sure way to determine the type, size and capacity of a system is to note the model number and brand name and call the dealer. Generally speaking, however, the horsepower of the compressor motor is approximately equal to the ton capacity of the cooling unit. Using the same duct work as the forced air heating system, central air-conditioning may run 20° to 30° more if separate duct work is required.

PLUMBING

A standard complement of plumbing for a fair or average quality house consists of two 3-fixture baths with shower over tub, one flat rim kitchen sink with two compartments, and one 40 gallon gas or 52 gallon electric water heater. Plumbing represents a relatively fixed cost in building construction. Some nominal additional cost for laterals would be incurred in the larger house, but this would be hardly noticeable in the overall price per square foot. The kitchen sink and each bathroom should be vented with a metal/plastic stack extending through the roof. It is also important to determine whether waste is disposed of by public sewer or individual septic system.

ROOF

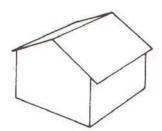

There are generally six types or styles of roof structures used in residential construction. The typical roof structure consists of 2" X 6" rafters placed on 16" centers and secured at the peak by a 2" X 8" ridge board. Sheathing is typically 3/8" to 1/2" plywood covered with felt under-lament and 235 lb. composition shingles. Ceiling joists, which are often considered part of the composite roof structure, should be at least 2" X 6" on 16" centers with a maximum span of 14'.

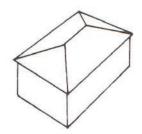

The rafters and ceiling joists are attached to the 4" X 4" ceiling plates at the line of the exterior wall. The span of a roof is the distance between the outer edges of the ceiling plates, typically the width of the house. The rise of the roof is the distance from the level of the ceiling plates to the top of the ridge. The run of a rafter is the horizontal distance from the outside of the ceiling plate to the right angle intersection of the ridge. The slope of a roof is expressed in terms of the rise of the roof in inches per foot of run of rafters. The slope of a roof is typically 5/12 but should not be less than 4/12. Generally better quality construction will be reflected by steeper pitched roofs with more overhangs at the eaves. Pitch is the ratio of the rise of the roof to the span. Therefore, to find the rise of the roof in inches per foot of run of rafters (slope), multiply pitch by 24.

With exception of a trussed frame, 2" X 4" rafters do not meet Minimum Property Standards, and generally denote lower quality construction. With a residential truss roof, rafters and ceiling joists are placed on 24" centers and are constructed with 2" X 4" boards; however, the engineering design of the truss creates structural capacity similar to a conventionally framed roof and results in a savings in construction cost.

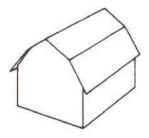

The following diagram is 1 Gable, 2 Hip, 3 Shed, 4 Gambrel, 5 Mansard, 6 Arched, 7 Flat, 8 Monitor, 9 Sawtooth.

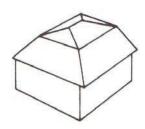

SHED

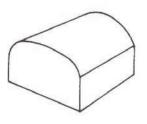

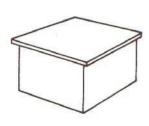

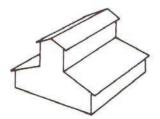

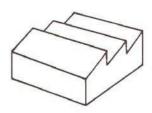

FLAT

DEED EDIT SHEET CODE REASONS FOR REJECTION:

- A. The transaction includes the conveyance of two (2) or more parcels.
- B. Sales for which the improvements sold are not included in the tax assessment or the assessment included improvements built after the sale.
- C. Deed shows \$6.00* or less in revenue stamps. *Transaction is for \$3,000 or less.
- D. The date the deed was made, entered or notarized is outside the dates of the study period. (The study period runs from January 1 to December 31.)
- E. The transaction is between relatives or related businesses.
- F. The grantor is only conveying an undivided or fractional interest to the grantee.
- G. The deed reserves until the grantor, a life estate, or some other interest.
- H. The deed reserves unto the grantor the possession of, or lease of, the property for specified period following the sale
- I. One or both of the parties involved in the transaction is governmental, a public utility, lending institution, or a relocation firm.
- J. The deed conveys a cemetery lot or other tax exempt property.
- K. One or both of the parties involved in the transaction is a church, school, lodge, or some other educational organization.
- M. The deed indicates that the property conveyed is situated in more than one county.
- N. The transaction is for minerals, timber, etc. or the rights to mine or cut same.
- O. The transaction includes the conveyance of personal property, and the value of such is not specified separate from the real property value in the deed.
- P. The transaction is the result of a forced sale or auction.
- Q. Transaction made by the use of a Contract for Deed, the agreement for which is executed and sale actually made prior to the study.
- R. The transaction involves the trade or exchange of real property.
- S. The transaction is for real property which cannot be clearly identified on the county tax records.
- T. Vacant Land Sale now has improvements.
- X. Other (An explanation must be provided when this code is used).
- Z. To use when \$1 is put in the Assessed Value (for use of Access Database only).

APPENDIX

Architectural Terms

Apartment hotel a building designed for non-transient residential use, divided into dwelling

units similar to an apartment house, but having such hotel apartment hotel accommodations as room furnishings, lounges, public dining room, maid

service, etc.

Apartment house a multi-family residence containing three or more non-transient residential

living units and generally providing them with a number of common facilities

and services.

Attic An unfinished or semi-finished portion of a building lying between the highest

finished story and the roof and wholly within the roof framing.

Basement a building story which is wholly or partly below the grade level.

Bay (1) a horizontal area division of a building usually defined as the space between

columns or division walls. (2) an internal recess formed by causing a wall to

project beyond its general line.

Bay window a window, or group of continuous windows, projecting from the main wall of a

building.

Beam a long structural load-bearing member which is placed horizontally or nearly so

and which is supported at both ends or, infrequently, at intervals along its

length.

Beam, spandrel a wall beam supporting the wall, above, as well as the floor.

Building any structure partially or wholly above ground which is designed to afford

shelter to persons, animals, or goods. See also construction.

Building, fireproof a building in which all parts carrying loads or resisting stresses and all exterior

and interior walls, floors, and staircases are made of incombustible materials, and in which all metallic structural members are encased in materials which remain rigid at the highest probable temperature in case its contents are burned,

or which provide ample insulation from such a temperature.

Building, loft a building having three or more stories with few or no interior bearing walls

and designed for storage, wholesaling, or light industrial purposes.

Building, single-purpose a building designed for a specific purpose, which cannot be used for another

purpose without substantial alterations; e.g., a theater or church.

Bungalow a one-story dwelling unit which is somewhat more pretentious than a cottage.

Column a structurally isolated vertical member which is at least 8 to 10 times as long as

its least lateral dimension and which is designed to carry loads. Compare *pier*.

Conduit a tube, pipe, or small artificial tunnel used to enclose wires or pipes or to

convey water or other fluids.

Construction, brick a type of construction in which the exterior walls are bearing walls (q.v.) made

of solid brick or brick and tile masonry.

Construction, brick veneer a type of construction in which the exterior walls are one-layer brick curtain

walls backed by a wood frame.

Construction, fireproof see fireproof building.

Construction, mill a type of construction in which the exterior walls are substantial masonry

bearing walls, in which the structural members are of heavy timber, and which is further characterized by an open design and by other safeguards against fire

hazards. Sometimes called "slow-burning construction."

Construction, reinforced a type of construction in which the principal structural members, such

Concrete as the floors, columns, beams, etc., are made of concrete poured around

isolated steel bars or steel meshwork in such manner that the two materials act

together in resisting forces.

Construction, steel frame a type of construction in which there is a framework of steel structural

members for the support of all loads and the resistance of all stresses.

Construction, wood frame a type of construction in which there is a framework of wooden structural

members for the support of all loads and the resistance of all stresses. Loosely

called "frame construction."

Coping a special capping at the top of a wall, serving principally as a watershed.

Cornice a projecting element at the top of a wall, serving principally as a decoration or

as part of the coping (q.v.).

Cottage a one story to two story dwelling unit of small size and humble character.

Course a uniform horizontal layer of brick, stone, terra cotta, shingles, or some other

structural material, extending continuously around a building or along a wall.

Court an open space bordered on two or more sides by the walls of a single building,

or of two or more buildings, and by a lot line or a yard on any side not so

bordered.

Dormer (1) a relatively small structure projecting from a sloping roof. (2) a window set

upright in the face of such a structure.

Dwelling any building or portion thereof designed or occupied in whole or in part as a

place of residence.

Dwelling, attached a multi-family dwelling in which the dwelling units are separated vertically by

means of common or party walls. See terrace.

Dwelling, double a two-family dwelling in which the dwelling units are separated vertically, by

means of a common or party wall. Synonymous with "semi-detached

dwelling."

Dwelling, duplex a two-family dwelling in which the two dwelling units are separated

horizontally with a private street entrance for each; i.e., a two-family flat.

Dwelling, multi-family a building designed as a place of residence for more than two families or

households; e.g., an apartment house or tenement.

Dwelling, row any one of a series of similar single family, two family, or multi-family

dwellings having one or more contiguous common or party walls. Compare

terrace; dwelling, double.

Dwelling unit any room or group of rooms designed as the living quarters of one family or

household, equipped with cooking and toilet facilities, and having an

independent entrance from a public hall or from the outside.

Eaves the portion of a sloping roof which projects beyond the outside walls of a

building.

Elevation a drawing which represents a projection of any one of the vertical sides or

vertical cross-sections of a building or of any other object. Compare plan.

Façade the face of a building.

Firewall a wall of fire-resisting material erected between two parts of a building to

prevent the spread of fire from one part to the other.

Flashing small metal strips used to prevent leaking of roofs around chimneys, dormers,

hips, and valleys.

Flat (1) any one floor of a building, two or more stories high, each floor of which

constitutes a single dwelling unit and has a private street entrance. (2) the

building containing two or more such floors. Compare dwelling, duplex.

Footing a spreading base to a wall, column, or other supporting member, which serves

to widen the ground area to which structural loads are transmitted.

Foundation the structural members below grade level, or below the first tier of beams

above grade level, which transmit the load of a superstructure to the ground.

Gable (1) the triangular portion of a wall between the slopes of a double- sloping (i.e.,

gable) roof. (2) the whole of the wall containing such a triangular portion. (3) a

| portion of a building | extending from | om the | remainder | of the | building | and |
|----------------------------|----------------|--------|-----------|--------|----------|-----|
| covered with a gable roof. | | | | | | |

Girder a large or principal beam (q.v.) used to support concentrated loads

at isolated points along its length. (Girders usually support the beams and

structure above).

Header (1) a structural member which is laid perpendicularly to a parallel series of

similar members and against which the latter members abut. (2) a brick or other piece of masonry which is laid in a wall in such manner that its longest

dimension extends along the thickness of the wall. Contrast stretcher.

Hip (1) a sloping line along which two roof surfaces meet to form an external angle

of more than 180 degrees. (2) a hip rafter (q.v.) Compare ridge; valley.

Hotel a building designed for transient or semi-transient residential use, divided into

furnished single rooms and suites, and having such accommodations as

lounges, public dining rooms and maid service, etc

Hotel, apartment see apartment hotel.

Joist one of a series of small parallel beams laid on edge and used to support floor

and ceiling loads, and usually supported in turn by larger beams and girders.

Lintel a beam over a wall opening, such as a door or windows, designed to carry the

load of the wall over such opening.

Loft a non-partitioned or relatively open upper story of a building, designed for

storage, wholesaling, or light manufacturing. See also loft building.

Louver (or louvre) a ventilator containing slats which are placed lengthwise across the ventilator

opening, each slat being slanted in such manner as to overlap the next lower

slat and to permit ventilation but exclude rain.

Marquee a flat roof-like structure which shelters a doorway, which has no floor beneath

it, and which is usually supported wholly from the walls or the building.

Mezzanine a low story formed by placing a floor between what would ordinarily be the

floor and ceiling of a high story, *Note:* the mezzanine floor frequently has a smaller area than other floors and, if present at all, is usually between the first

and second stories.

Millwork all of the wooden portions of a building, whether frame construction or

otherwise, which are customarily purchased in finished form from a planing

mill, such as doors, windows, trim, balusters, etc.

Overhang a finished portion of a building having full story height which extends beyond

the foundation wall line if part of the ground story, or beyond the exterior walls

of the ground story if part of any higher story.

Overhead structure similar to overhang above ground story, such as O.H. bridge or passage, O.H.

walk, O.H. Addition.

Partition see wall, partition.

Pier (1) a thick, solid mass of masonry which is fully or partially isolated from a

structural standpoint and which is designed to transmit vertical loads to the earth. (2) a structure projecting from land into water for use in loading and

unloading vessels. Compare column.

Pilaster a flat-faced pillar projecting somewhat from, but engaged in, the wall of a

building and used for decorative purposes or to help support truss and girder

loads or both.

Pile a heavy timber, metallic, or masonry pillar forced into the earth to form a

foundation member.

Pitch the slope of any structural member, such as a roof or rafter, usually expressed

as a simple fraction representing the rise per lateral foot.

Plan a drawing representing a projection of any one of the floors or horizontal cross-

sections of a building or of the horizontal plane of any other object or area.

Compare elevation.

Purlin a beam running along the underside of a sloping roof surface and at right angles

to the rafters, used to support the common rafters, and usually supported in turn by larger structural members, such as trusses or girders (usually run along

length of building).

Rafter a structural member placed, as a rule, in a sloping position and used as the

supporting element for the structural material forming the plane of the roof. See

also purlin.

Rafter, hip a rafter placed in an inclined position to support the edges of two sloping roof

surfaces which meet to form an external angle of more than 180 degrees.

Rafter, valley a rafter placed in an inclined position to support the edges of two sloping roof

surfaces which meet to form an external angle of less than 180 degrees.

Ramp an inclined walk or passage connecting two different floor levels and used in

lieu of steps.

Residence see *dwelling*.

Ridge a horizontal line along which the upper edges of two roof surfaces meet to form

an external angle of more than 180 degrees. Compare hip; valley.

Rise (1) in general, any vertical distance. (2) specifically, the rise of a roof being the

distance between the top of an exterior wall and the peak of the roof; the rise of

a stair being the distance from tread to tread.

Roof the top portion of a structure. Types of roofs include double pitch, flat, gable,

gambrel, hip, lean-to, single pitch.

Roof, curb (or curbed) a roof with a ridge at the center and a double slope on each if its two sides.

Roof, flat a roof which is flat or sloped only enough to provide proper drainage.

Roof, gable a double-sloped roof having a cross section similar in general to

the shape of the inverted letter "V".

Roof, gambrel a ridged roof with two slopes on each side, the lower having a steeper pitch.

Roof, hip (or hipped) (1) in general, any roof having one or more hips (q.v.) (2) usually, a roof with

four sloping sides meeting along four hips or along four hips and a ridge.

Compare roof, pyramid.

Roof, lean-to (1) a roof having a single sloping side which is supported at the upper edge by

the wall of an attached building or of a larger and higher portion of the same

building (preferred). (2) any roof with a single slope. Compare roof, flat,

Roof, mansard a special type of curb roof (q.v.) in which the pitch of the upper part of each of

the four equally sloping sides is small or negligible and that of the lower part is

very great; a series of dormers projects from the lower part.

Roof, monitor a type of gable roof commonly found on industrial buildings - having a small

raised portion along the ridge, with openings for the admission of light and air.

Roof, pyramid a hip roof having four sloping triangular sides, usually of equal pitch, meeting

together at the peak.

Roof, ridged a roof having one or more ridges (q.v.).

Roof, saw tooth a roof with a series of parallel sloping surfaces interspersed between a series of

vertical surfaces which rise from the lower edges of such sloping surfaces and

which contain windows for the admission of light and air.

Roof, single pitch any roof with a single slope, other than a lean-to roof.

Sash the wooden or metal framework in which the glass of a door or window is set.

Sheathing the covering, usually of rough lumber, placed immediately over studding or

rafters.

Sill (1) the lower horizontal part of a door-case (the threshold) or of

a window. (2) the lowest horizontal structural member of a frame building, upon which the superstructure is supported.

Sleeper a structural member laid horizontally on the ground or upon a masonry base as

a support to a floor or other superstructures.

Specifications a detailed description of the dimensions, materials, quantities, structural

procedures, etc., applicable to a projected or completed piece of construction.

Story that portion of a building enclosed by a floor, a ceiling, and the exterior walls.

Story, ground the first story lying wholly above the ground level. Synonymous with "first

story."

Story, half (or one-half) (1) for buildings with a mansard or gambrel roof, a finished portion of a

building which lies above the wall plate or cornice and which has a usable floor area substantially less than that of the next lower story. (2) for all other buildings, a finished portion of a building which is above one or more full stories, which is wholly or partly within the roof frame and which has one or

more exterior walls substantially lower than the full height of the story.

Story, one a building having no finished story above the ground story.

Stretcher a brick or other piece of masonry which is laid lengthwise in a wall. contrast

header.

Strut any structural member, which holds apart two **or** more other members by

counteracting a pressure, which tends to bring them together. Contrast tie.

Stud one of a series of small slender structural members placed vertically and used

as the supporting element of exterior or interior walls. (Plural: studs or

studding)

Sub floor the flooring laid directly on top of the floor joists, but beneath the finish floor.

Tenement a building, usually of obsolete nature, designed primarily for non-transient

residential use and divided into three or more dwelling units having common stairs, halls, and street entrances, and sometimes-common bath and toilet

rooms. Compare apartment house; flat; terrace.

Terrace (1) an unroofed level area covered with grass or masonry or both, raised above

the surrounding ground level, and having a vertical or sloping front. (2) a multifamily dwelling in which the dwelling units are separated vertically by means

of common or party walls. Compare dwelling, row; dwelling, double.

Terra cotta a hard-baked ceramic clay molded into decorative tiles, bricks, etc., and used

particularly for facing and trim on buildings.

| Tie as | ny | structural | member, | which | binds | together | two | or | more | members | by |
|--------|----|------------|---------|-------|-------|----------|-----|----|------|---------|----|
| | | | | | | | | | | | |

counteracting a stress which tends to draw them apart. Contrast strut.

Trim (1) the wooden portions of a plastered room, such as the doors, windows,

wainscoting, and molding, or the corresponding portions of a room finished otherwise than with plaster. (2) the contrasting elements on the exterior of a building which serve no structural purpose, but are intended to enhance its appearance, e.g., the cornice. (3) occasionally, the hardware of a house, such as

locks, hinges, doorknobs, etc.

Truss a combination of structural pieces fastened together into a rigid open member

which is supported at both ends and upon which loads are superimposed.

Compare girder.

Valley a sloping line along which two roof surfaces meets to form an external angle of

less than 180 degrees. Compare hip; ridge.

Veneer a thin ornamental or protective facing which does not add appreciably to the

strength of the body to which it is attached.

Wainscot (or wainscoting) (1) a wooden facing on the lower portion of a contrasting interior wall. (2) by

extension, a facing of marble tile, or the like, on the lower portion of interior

walls.

Wall a vertical structure serving to enclose, support, divide; such as one of the

vertical enclosing sides of a building or room.

Wall, bearing a wall designed primarily to withstand vertical pressure in addition to its own

weight.

Wall, common a wall owned by one or two parties and jointly used by both, one or both of

whom is entitled to such use under the provisions of ownership.

Wall, curtain a non-bearing wall which is supported by columns, beams, or other structural

members, and whose primary function is to enclose space.

Wall, fire see firewall

Wall, partition an interior bearing or non-bearing wall which separates portions of a story.

Synonymous with partition.

Wall, party a wall jointly used by two parties under easement agreement and erected at or

upon a line separating two parcels of land held under different ownership.

Wall, retaining a wall designed primarily to withstand lateral pressures of earth or other filling

or backing deposited behind it after construction.

Window, bay see bay window.

Window, dormer see dormer.

Wing a subordinate part of a building extending from the main part, or any one of

two or more substantially co-ordinate parts of a building which extend out from

one or more common junctions.

DATA PROCESSING TERMS

BAUD unit of signaling speed equal to the number of discrete conditions or signal

events per second.

Binary a characteristic or property involving a selection, choice, or condition in which

there are two possibilities, such as the number representation with a radix of

two.

Bits the smallest unit of information in the binary number system. An abbreviation

of binary digits. Normally, a bit refers to one "on", while a no bit means zero

"off".

Block a group of machine words considered or transported as a unit. In flowcharts,

each block represents a logical unit of programming.

Bytes a sequence of adjacent binary digits operated upon as a unit; a unit of computer

storage capacity equal to eight binary bits.

Calculator a keyboard machine for the automatic performance of arithmetic operations.

CAMA Computer-Assisted Mass Appraisal - Utilizing data processing to compare

parcels, calculate values, and maintain property characteristics to increase

efficiency and accuracy in the appraisal process.

Columns binary pertaining to the binary representation of data on punched cards in which

adjacent positions in a column correspond to adjacent bits of data; each column in a 12-row card may be used to represent 12 consecutive bits of 36-bit word.

Computer a computational device distinguished by its high speed, programmable

operation, and large memory.

Computer program a series of instructions, in a form acceptable to the computer, prepared so as to

achieve a certain result.

CPU Central Processing Unit - The heart of the computing system, which contains

the arithmetic, logical and control circuits necessary for

the interpretation, execution of a program and controls the functioning of the

entire system.

Schedule of Values

Gaston County 2023

CRT see video display terminal.

Data base a minimally redundant stored collection of data. A collection of data

maintained by a computer.

Data base

management A combination of hardware and software that controls and processes all

requests for data in data bases.

Data element the smallest unit of data stored on some medium to which a reference or none

may be assigned.

Data entry the process of placing information into machine-readable form.

Data path the input-processing-output flow followed by data (often repeatedly) during

normal computer operations.

Data processing performing operations on machine-readable data, either with or without the use

of a computer.

Data structure the particular form in which data are to be treated by the computer program:

whether as whole numbers, decimal fractions, or alphabetic characters, and

whether as single pieces of information or as related sets or arrays of data.

Data verification checking the accuracy of data that has been placed into a data processing

system.

Direct access an addressing scheme or random access storage medium that permits direct

addressing of data locations.

Disk file a means for storing data on a magnetic disk or platter.

Encode to apply a set of rules specifying the manner in which data may be represented

such that a subsequent decoding is possible.

Feedback the process of returning portions of the output of a machine, process, or system

for use as input in a further operation.

Flowchart a graphical representation of the definition, analysis, or solution of a problem

using symbols to represent operations, data flow, and equipment.

Hard copy output that appears on paper.

Hardware the physical equipment in a data processing system.

Indexed sequential a file in which records are organized sequentially with indexes that permit

quick access to individual records as well as rapid sequential processing.

Gaston County 2023

Kilobytes (kilo = 1000, bytes = characters) byte: A form of saying a character -

numerical, letter, or symbol, in machine-readable

form. Data processing personnel measure the size of records by bytes, instead of number of characters. Exactly, a kilobyte (KB or K) has 1,024 "characters".

Library a collection of standard proven computer routines, usually kept on a library

tape or random access file, by which problems or portions of problems may be

solved.

Master file a file of records containing a cumulative history or the results of accumulation;

updated in each file processing cycle, and carried forward to the next cycle.

Megabyte (1 million bytes) This unit is quite large and is usually used to measure the

volume of a file, a disc, etc.

Memory the part of the computer that stores the program, holds intermediate results, and

various constant data. Same as storage,

Modem a contraction of "Modulator Demodulator." Its function is to interface with data

processing devices and convert data to a form compatible for sending and

receiving on transmission facilities.

MRA Multivariate Regression Analysis - Also called the least squares method, is a

mathematical method for producing a model for a dependent variable as a linear function of independent factors. As an example - the predicted sales price (dependent variable) is a function of independent factors such as Square Feet,

Style, Neighborhood, etc.

Multiplexor a computer hardware device used as a screening agent to the main computer. It

polls all the messages from all terminals and transmits one by one to the main computer. It also dispatches "messages" to receiving ends ... it can be compared

to the secretary of a big boss!

Multiprocessing systems software that enables several CPU's to be connected together to

provide faster, more reliable computing.

Multiprogramming systems software that enables the computer to run several programs

simultaneously.

On-line peripheral equipment or devices in direct communication with the

central processing unit, and from which information reflecting current activity

is introduced into the data processing system as soon as it occurs.

Operating system the systems software that manages all other software in the computer (also

known as an executive or monitor).

Operator's instructions

these are sets of operation instructions, which tell the operator what to do to get the jobs done on the computer. The instructions are designed for two types of operators:

1. Computer operators - run the computer, execute a job, mount a tape, etc.

2. Use operators - run different applications such as payroll, CAMA. The instructions tell them how to add a new record, delete a word, on a terminal or

using cards.

Output information that has been processed by the computer.

Peripheral equipment units that work in conjunction with the computer, but are not part of the

computer itself, such as tape reader, card reader, magnetic tape feed, high-

speed printer, typewriter, etc.

Printer hardware for outputting on paper.

Program the instructions that enable a computer to process data.

Programming language a system for coding instructions for computer processing.

Punched cards a storage medium similar to index cards.

Random access for device or media, the accessing of data by address rather than by sequence.

Record a collection of related items of data treated as a unit.

Sequence an arrangement of items of data according to a specified set of rules.

Sequential processing the procedure of processing data records in the same order that they occur.

Sequential storage storing of data in sequential order.

Software the programs and routines used to extend the capabilities of computers, such as

compilers, assemblers, routines, and subroutines. Also, all documents

associated with a computer, e.g., manuals, circuit diagrams.

Source that which provides information to be entered into the computer.

Source document a form containing raw data for entry into the computer.

Source file a computer program in high-level language code.

Standard deviation a statistical measure of the variation of a characteristic about its average value.

Standard deviation is the square root of the variance of a characteristic about its average observed value. Variance is the sum of the squared deviations of each observed value from the average, divided by one less than the number of observations. For normally distributed observations, approximately 70% of the observations will fall within one standard deviation of the mean or average

value.

Storage the retention of information in the computer system.

Summary report output that displays only the end product of processing in a concise format.

System software computer software that provides overall housekeeping functions for the

computer.

Systems design the development of a computer system (hardware and software) to suit a

particular application, by using the program development cycle.

Terminal a device in a system or communication network at which point data can either

enter or leave the system.

Transaction file a file containing transient data to be processed in combination with a master

file.

Turn-around document a document or form prepared as output at one stage of the data processing

cycle, and sent to a customer or other user with the

intention of having it returned and used as input at a later stage.

Unit record a record in which all data concerning each item in a transaction is punched into

one card.

Variable a quantity that, when identified by a symbolic name, can assume any of a given

set of values.

Verify To determine whether a transcription of data or other operation has been

accomplished accurately. To check the results of key punching.

Video display terminal hardware for output on a television-style picture tube (cathode-ray tube or

CRT).

Word a set of characters that occupies one storage location and is treated by the

computer circuits as a unit and transported as such.

REAL ESTATE APPRAISAL TERMS

Abstract a computer-printed report of appraised and/or assessed values for each parcel of

real property in a given taxing district; generally sequenced geographically.

Accrued depreciation see depreciation.

Actual age the number of years elapsed since the original construction, as of the effective

valuation date. Compare with effective age.

Ad valorem tax in reference to property, a tax based upon the value of the property.

Aesthetic value a value, intangible in nature, which is attributable to the pleasing appearance of

a property.

Agricultural property land and improvements devoted to or best adaptable for the production of

crops, fruits, and timber, and the raising of livestock.

Air rights the right to the use of a certain specified space within the boundaries of a parcel

of land and above a specified elevation.

Alley influence the enhancement to the value of a property rising out of the presence of an

abutting alley; most generally applicable to commercial properties.

Amenities in reference to property, the intangible benefits arising out of ownership;

amenity value refers to the enhancement of value attributable to such amenities.

Appraisal an estimate, usually in written form, of the value of a specifically described

property as of a specified date; may be used synonymously with valuation or

appraised value.

Appraisal schedules any standardized schedules and tables used in conjunction with a revaluation

program, such as replacement cost pricing schedules, depreciation tables, land

depth tables, etc.

Appraised value see appraisal.

Appraiser one who estimates value. More specifically, one who possesses the expertise to

execute or direct the execution of an appraisal.

Assessed value see assessment.

Assessing the act of valuing a property for the purpose of establishing a tax base.

Assessment the value of taxable property to which the tax rate is to be applied in order to

compute the amount of taxes; may be used synonymously with assessed value,

taxable value, and tax base.

Assessment district an assessor's jurisdiction; it may or may not be an entire tax district.

Assessment period the period of time during which the assessment of all properties within a given

assessment district must be completed; the period between tax lien dates.

Assessment ratio the ratio of assessed value to a particular standard of value, generally the

appraised value. A percentage to be applied to the appraised value in order to

derive the assessed value.

Assessment roll the official listing of all properties within a given taxing jurisdiction by

ownership, description, and location showing the corresponding assessed values for each; also referred to as *tax list, tax book, tax duplicate*, and *tax roll*.

Assessor the administrator charged with the assessment of property for ad valorem taxes;

his precise duties differ from state to state depending upon state statutes.

Asthetic value a value, intangible in nature, which is attributable to the pleasing appearance of

a property.

Average deviation in a distribution of values, the average amount of deviation of all the values

from the mean value, equal to the total amount of deviation from the mean divided by the number of deviations. As applied to an assessment-to-sale ratio distribution, the average amount which all the ratios within the distribution

deviate from the mean ratio.

Base price a value or unit rate established for a certain specified model, and subject to

adjustments to account for variations between that particular model and the

subject property under appraisement.

Blighted area a declining area characterized by marked structural deterioration and/or

environmental deficiencies.

Board of Equalization a non-jurisdictional board charged with the responsibility of reviewing

assessments across properties and taxing districts and to assure that

said properties and districts are assessed at a uniform level, either raising or lowering assessments accordingly; also referred to as *Board of Appeals*, and

Board of Review.

Building residual technique a building valuation technique which requires the value of the land to be a

known factor; the value of the buildings can then be indicated by capitalizing the residual net income remaining after deducting the portion attributable to the

land.

Capitalization a mathematical procedure for converting the net income which a property is

capable of producing into an indication of its current value. See income

approach.

CDU rating a composite rating of the overall condition, desirability, and usefulness of a

structure as developed by the Cole-Layer-Trumble Company and used nationally as a simple, direct, and uniform method of estimating accrued

depreciation.

Central business district the center of a city - in which the primary commercial, governmental, and

recreational activities are concentrated.

Certified Assessment Evaluator a professional designation (C.A.E.) conferred upon qualifying assessors by the

International Association of Assessing Officers (IAAO).

Classified property tax an ad valorem property tax under which the assessment ratio varies for

different property classes.

Component part-in-place

method

the application of the unit-in-place method to unit groupings or

construction components. See unit-in-place method.

Corner influence

the enhancement to the value of a property due to its corner location; most generally applicable to commercial properties.

Cost approach

one of the three traditional approaches to determination of the value of a property; arrived at by estimating the value of the land, the replacement or reproduction cost new of the improvement, and the amount of accrued depreciation to the improvement. The estimated land value is then added to the estimated depreciated value of the improvements to arrive at the estimated property value. Also referred to as the "cost-to- market approach" to indicate that the value estimates are derived from market data abstraction and analysis.

Cost factor

a factor or multiplier applied to a replacement or reproduction cost to account for variations in location and time, as well as for other elements of construction costs not otherwise considered.

Cubic content

the cubic volume of a building within the outer surface of the exterior walls and roof and the upper surface of the lowest floor.

Deed

a written instrument, which conveys an interest in real property. A *quitclaim deed* conveys the interest described therein without warranty of title. A *trust deed* conveys interest described therein to a trustee. A *warranty deed* conveys the interest described therein with the provisions that the freehold is guaranteed by the grantor, his heirs, or successors.

Depreciation

loss in value from all causes; may be further classified as; *physical*, referring to the loss of value caused by physical deterioration; *functional*, referring to the loss of value caused by obsolescence inherent in the property itself; and *economic*, referring to the loss of value caused by factors extraneous to the property.

accrued depreciation refers to the actual depreciation existing in a particular property as of a specified date.

normal depreciation refers to that amount of accrued depreciation one would normally expect to find in buildings of certain construction, design, quality, and age.

Depreciation allowance

a loss of value expressed in terms of a percentage of replacement or reproduction cost new.

Depth factor

a factor or multiplier applied to a unit land value to adjust the value in order to account for variations in depth from an adopted standard depth.

Depth table

a table of depth factors.

Design factor

a factor or multiplier applied to a computed replacement cost as an adjustment to account for cost variations attributable to the particular design of the subject property which were not accounted for in the particular pricing schedule used.

Deterioration impairment of structural condition evidenced by the wear and tear caused by

physical use and the action of the elements, also referred to as physical

depreciation.

Economic depreciation See depreciation.

Economic life the life expectancy of a property during which it can be expected to be

profitably utilized.

Economic obsolescence obsolescence caused by factors extraneous to the property. Also referred to as

economic depreciation.

the rent which a property can be expected to bring in the open market as **Economic rent**

opposed to contract rent or the rent the property is actually realizing at a given

time.

Effective age an age assigned to a structure based upon its condition as of the effective

valuation date; it may be greater or less than the structure's actual age. Compare

with actual age.

Effective depth in reference to property valuation, that depth, expressed in feet, upon which the

selection of the depth factor is based.

in reference to property valuation, that total frontage, expressed in lineal feet, to Effective frontage

which the unit land value is applied, it may or may not be the same as the

actual frontage.

Effective gross income the estimated gross income of a property less an appropriate allowance for

vacancies and credit losses.

in reference to a revaluation program, the date as of which the value estimate is Effective valuation date

applicable.

Encroachment the displacement of an existing use by another use.

Environmental deficiency a neighborhood condition, such as adverse land uses, congestion, poorly

designed streets, etc., operating to cause economic obsolescence and, when

coupled with excessive structural deterioration, blight.

Equalization program a mass appraisal (or reappraisal) of all property within a given taxing

> jurisdiction with the goal of equalizing values in order to assure that each taxpayer is bearing only his fair share of the tax load; may be used

synonymously with a revaluation program.

Equity in reference to property taxes, a condition in which the tax load is distributed

> fairly or equitably; opposite of inequity which refers to a condition characterized by an unfair or unequitable distribution of the tax burden.

> *Inequity* is a natural product of changing economic conditions, which can only

be effectively cured by periodic equalization programs. In reference to value, it is that value of the property remaining after deducting all liens and charges

against it.

Excessive frontage frontage, which because of the particular utility of the lot, does not serve to add

value to the lot.

Exempt property see *tax exemption*.

Fee appraisal see mass appraisal.

Field crew the total professional staff assigned to a specific appraisal project, including

listers, reviewers, staff appraisers, and clerical and administrative supporting

personnel.

Functional depreciation see depreciation.

Functional obsolescence obsolescence caused by factors inherent in the property itself. Also referred to

as functional depreciation.

Functional utility the composite effect of a property's usefulness and desirability upon its

marketability.

Grade the classification of an improvement based upon certain construction

specifications and quality of materials and workmanship.

Grade factor a factor or multiplier applied to a base grade level for the purpose of

interpolating between grades or establishing an intermediate grade.

Grantee a person to whom property is transferred and property rights are granted by

deed, trust instrument, or other similar documents. Compare with grantor.

Grantor a person who transfers property or grants property rights by deed, trust

instrument, or other similar documents. Compare with grantee.

Gross area the total floor area of a building measured from the exterior of the walls.

Gross income the scheduled annual income produced by the operation of a business or by the

property itself.

Gross income multiplier a multiplier representing the relationship between the gross income of a

property and its estimated value.

Gross sales the total amount of invoiced sales before making any deductions for returns,

allowances, etc.

Ground lease a document entitling the lessee certain specified rights relating to the use of the

land

Ground rent net rent from a ground lease; that portion of the total rent which is attributable

to the land only.

Improved land land developed for use by the erection of buildings and other improvements.

Income approach one of the three traditional approaches to determination of value; measures the

present worth of the future benefits of a property by the capitalization of its net income stream over its remaining economic life. The approach involves making an estimate of the potential net income the property may be expected to yield,

and capitalizing that income into an indication of value.

Income property a property primarily used to produce a monetary income.

Industrial park a subdivision designed and developed to accommodate specific types of

industry.

Industrial property land, improvements, and/or machinery used, or adaptable for use, in the

production of goods either for materials, or by changing other materials and products, i.e., assembling, processing and manufacturing ...as well as the

supporting auxiliary facilities thereof.

Inequity see *equity*.

Influence factor a factor serving to either devalue or enhance the value of a particular parcel of

land, or portions thereof, relative to the norm for which the base unit values were established; generally expressed in terms of a percentage adjustment.

Institutional Property land and improvements used in conjunction with providing public services and

generally owned and operated by the government or other nonprofit organizations ... hospitals, schools, prisons, etc. Such property is generally held

exempt from paying property taxes.

Interest rate the rate of return from an investment.

Land classification the classification of land based upon its capabilities for use and/or production.

Land contract a purchase contract wherein the grantee takes possession of the property with

the grantor retaining the deed to the property until the terms of the contract are

met as specified.

Land residual technique a land valuation technique which requires the value of the buildings

to be known; the value of the land can then be indicated by capitalizing the residual net income remaining after deducting the portion attributable to the

building(s).

Landscaping natural features such as lawns, shrubs and trees added to a plot of ground or

modified in such a way as to make it more attractive.

Land use restrictions legal restrictions regulating the use to which land may be put.

Land value maps a map used in conjunction with mass appraising; generally drawn at

a small scale, and showing comparative unit land values on a block to block

basis.

Lease, Lessor a written contract by which one party (lessor) gives to another party

(lessee) the possession and use of a specified property, for a specified time,

and under specified terms and conditions

Leasehold a property held under the terms of a lease.

Leasehold improvements additions, renovations, and similar improvements made to a leased property by

the lessee.

Leasehold Value the value of a leasehold, the difference between the contract rent and the

currently established economic or market rent.

Legal description a description of a parcel of land which serves to identify the parcel in a manner

sanctioned by law.

Lister a field inspector or data collector whose principle duty is to collect and record

property data (not an appraiser).

Market data approach one of the three traditional approaches to determination of the value of a

property; arrived at by compiling data on recently sold properties, which are comparable to the subject property, and adjusting their selling prices to account for variations in time, location, and property characteristics between the

comparables and the subject property.

Market value the price an informed and intelligent buyer, fully aware of the existence of

competing properties, and not compelled to act, would be justified in paying for

a particular property.

Mass appraisal appraisal of property on a mass scale - such as an entire community, generally

for ad valorem tax purposes, using standardized appraisal techniques and procedures to accomplish uniform equitable valuation with a minimum of detail, within a limited time period, and at a limited cost ... as opposed to a *fee appraisal* which is generally used to refer to a rather extensive, detailed appraisal of a single property or singularly used properties for a specified

purpose.

Member Appraisal Institute a professional designation (M.A.I.) conferred upon qualifying real estate

appraisers by the American Institute of Real Estate Appraisers.

Mineral rights the right to extract subterranean deposits such as oil, gas, coal, and minerals, as

specified in the grant.

Minimum rental that portion of the rent in a percentage lease which is fixed.

Model method a method of computing the replacement or the reproduction cost of an

improvement by applying the cost of a specified model and adjusting the cost to account for specified variations between the subject improvement and the

model.

Modernization the corrective action taken to update a property so that it may conform with

current standards.

Mortgage, Mortgagee

Mortgagor a legal document by which the owner of a property (mortgagor) pledges the

property to a creditor (mortgagee) as security for the payment of a debt.

Neighborhood a geographical area exhibiting a high degree of homogeneity in residential

amenities, land use, economic and social trends, and housing characteristics.

Neighborhood trend three stages in the life cycle of a neighborhood: "the *improving stage*

characterized by development and growth; the *static stage* characterized by a leveling off of values; and the *declining stage* characterized by infiltration and

decay."

Net income the income remaining from the effective gross income after deducting all

operating expenses related to the cost of ownership.

Net lease a lease wherein the lessee assumes to pay all applicable operating expenses

related to the cost of ownership; also referred to as net net, or net net lease.

Net sales gross sales less returns and allowances.

Net sales area the actual floor area used for merchandising, excluding storage rooms, utility,

and equipment rooms, etc.

Non-conforming use a use which, because of modified or new zoning ordinances, no longer

conforms to current use regulations, but which is, nevertheless, upheld to be

legal so long as certain conditions are adhered to.

Observed depreciation that loss in value which is discernable through physical observation by

comparing the subject property with a comparable property, either new or

capable of rendering maximum utility.

Obsolescence a diminishing of a property's desirability and usefulness brought about by either

functional inadequacies and over-adequacies inherent in the property itself, or

adverse economic factors external to the property. Refer to functional depreciation and economic depreciation.

Operating expenses the fixed expenses, operating costs, and reserves for replacements which are

required to produce net income before depreciation, and which are to be

deducted from effective gross income in order to arrive at net income.

Average income rental received in addition to the minimum contract rental, based upon a

specified percentage of a tenant's business receipts.

Overall rate a capitalization rate representing the relationship of the net income (before

recapture) of a property to its value as a single rate; it necessarily contains, in their proper proportions, the elements of both the land and the building

capitalization rates.

Over assessed a condition wherein a property is assessed proportionately higher than

comparable properties.

Parcel piece of land held in one ownership.

Percentage lease a type of lease in which the rental is stipulated to be a percentage of the tenant's

gross or net sales, whichever specified.

Permanent parcel number an identification number which is assigned to a parcel of land to uniquely

identify that parcel from any other parcel within a given taxing jurisdiction.

Personal property property which is not permanently affixed to and a part of the real estate as

specified by state statutes.

Physical depreciation see depreciation.

Preferential assessment an assessing system which provides preferential treatment in the form of

reduced rates to a particular class of property; such as a system providing for farm properties to be assessed in accordance to their value in use as opposed to

their value in the open market.

Property class a division of like properties generally defined by statutes and generally based

upon their present use. The basis for establishing assessment ratios in a

classified property assessment system. See *classified property tax*.

Property inspection a physical inspection of a property for the purpose of collecting and/or

reviewing property data.

Property record card a document specially designed to record and process specified property data;

may serve as a source document, a processing form, and/or a permanent

property record.

Public utility property properties devoted to the production of commodities or services for public

consumption under the control of governmental agencies such as the Public

Utility Commission.

Quantity survey method a method of computing the replacement or the reproduction cost of an

improvement by applying unit costs to the actual or estimated material and labor quantities and adding an allowance for overhead, profit, and all other

indirect construction costs.

Real estate the physical land and appurtenances affixed thereto; often used synonymously

with real property.

Real property all the interests, benefits, and rights enjoyed by the ownership of the real estate.

Reassessment the revaluation of all properties within a given jurisdiction for the purpose of

establishing a new tax base.

Rent the amount paid for the use of a capital good. See *economic rent*.

Replacement cost the current cost of reproducing an improvement of equal utility to the subject

property; it may or may not be the cost of reproducing a replica property.

Compare with reproduction cost.

Reproduction cost the current cost of reproducing a replica property. Compare with *replacement*

cost.

Reserve for replacements a reserve established to cover renewal and replacements of fixed assets.

Residential property vacant or improved land devoted to or available for use primarily as a place to

live.

Revaluation program see equalization program.

Sales ratio study a statistical analysis of the distribution of assessment or appraisal-to-sale ratios

of a sample of recent sales, made for the purpose of drawing inferences regarding the entire population of parcels from which the sample was

abstracted.

Salvage value the price one would be justified in paying for an item of property to be removed

from the premises and used elsewhere.

Site development costs all costs incurred in the preparation of a site for use.

Soil productivity the capacity of a soil to produce crops.

Sound value the depreciated value of an improvement.

Sound value estimate an estimate of the depreciated value of an improvement made directly by

comparing it to improvements of comparable condition, desirability, and

usefulness without first estimating its replacement cost new.

Standard depth that lot depth selected as the norm against which other lots are to be compared;

generally the most typical depth.

Sublease see *lease*; the lessee in a prior lease simply becomes a lessor in a sublease.

Tax bill an itemized statement showing the amount of taxes owed for certain property

described therein and traceable to the party(s) legally liable for payment

thereof.

Tax book see assessment roll.

Tax district a political subdivision over which a governmental unit has authority to levy a

tax

Tax duplicate see assessment roll.

Tax exemption either total or partial freedom from tax; total exemption such as that granted to

governmental, educational, charitable, religious, and similar nonprofit organizations, and partial exemption such as that granted on homesteads, etc.

Tax levy in reference to property taxes, the total revenue, which is to be realized, by the

tax.

Tax list see assessment roll.

Tax mapping the creation of accurate representations of property boundary lines at

appropriate scales to provide a graphic inventory of parcels for use in accounting, appraising, and assessing; such maps show dimensions and the

relative size and location of each tract with respect to other tracts.

Tax notice a written notification to a property owner of the assessed value of certain

properties described therein; often mandated by law to be given to each

property owner following a revaluation.

Tax rate the rate - generally expressed in dollars per hundred or dollars per thousand

(mills) - which is to be applied against the tax base (assessed value) to compute the amount of taxes. The tax rate is derived by dividing the total tax levy, by

the total assessed value of the taxing district.

Tax roll see assessment roll.

Tillable land land suitable for growing annual crops.

Under assessed a condition wherein a property is assessed proportionately lower than

computable properties.

Uniformity as applied to assessing, a condition wherein all properties are assessed

at the same ratio to market value, or other standard of value depending upon the

particular assessing practices followed.

Unimproved land vacant land; a parcel for which there is no improvement value.

Unit cost or price the price or cost of one item of a quantity of similar items.

Unit-in-place method a method of computing the replacement or reproduction cost of an

improvement by applying established unit-in-place rates, developed to include the cost of materials, equipment, labor, overhead and profit, to the various

construction units.

Use density the number of buildings in a particular use per unit of area, such as a density of

so many apartment units per acre.

Use value the actual value of a commodity to a specific owner, as opposed to its value in

exchange or market value.

Vacancy an un-rented unit of rental property.

Vacant land unimproved land; a parcel for which there is no improvement value.

Valuation see appraisal.

View the scene as viewed from a property.

Water frontage land abutting on a body of water.

Woodland land which is fairly densely covered with trees.

Zoning regulations governmental restrictions relating to the use of land.

STATISTICAL TERMS

Aggregate ratio as applied to real estate, the ratio of the total assessed value to the total selling

price.

Average deviation in a distribution of values, the average amount of deviation of all the values

from the mean value equal to the total amount of deviation from the mean

divided by the number of deviations.

Cells the basic units making up a stratified sample; each sale representing a distinct

group within the total universe.

Coefficient a value prefixed as a multiplier to a variable or an unknown quantity.

Coefficient of dispersion as applied to an assessment-to-sale ratio distribution, a measure of dispersion in

a given distribution equal to the average deviation of the ratios from the mean

ratio divided by the mean ratio.

Precision

Frequency distribution a display of the frequency with which each value in a given distribution occurs

or, in a grouped frequency distribution, a display of the frequency with which

the values within various intervals, or value groupings, occur.

Mean a measure of central tendency equal to the sum of the values divided by the

number. Also referred to as arithmetic average or arithmetic mean.

Median a measure of central tendency equal to that point in a distribution above which

50% of the values fall and below which 50% of the values fall. The 50th

percentile. The 2nd quartile.

Mode a measure of central tendency equal to that value occurring most frequently in a

given distribution. In a grouped frequency distribution, the mode is equal to the

mid point of the interval with the greatest frequency.

Normal distribution a distribution in which all the values are distributed symmetrically about the

mean value, with 68.26% of the values failing between +/- 1 standard deviation, 95.44% between +/- 2 standard deviations, and 99.74% between +/-

3 standard deviations.

Percentile rank the relative position of a value in a distribution of values expressed in

percentage terms; for instance, as applied to an assessment-to-sale ratio distribution, a ratio with a percentile rank of 83 would indicate that 83% of the ratios were lower and 17% of the ratios were higher than that particular ratio.

as applied to real estate, it refers to the closeness of estimated value to actual

selling price on an aggregate basis.

Price related differential as applied to real estate, an analytical measure of the vertical uniformity of

values in a given distribution, calculated by dividing the mean ratio by the aggregate ratio; a ratio of more than 1 being generally indicative of the relative undervaluation of high priced properties as compared to the less valuable properties, whereas a ratio of less than 1 would indicate the converse

relationship.

Quartile positions in a distribution at 25 percentile intervals; the first quartile being

equal to the 25th percentile, the second quartile being equal to the 50th percentile or the median, and the third quartile being equal to the 75th

percentile.

Regression analysis a statistical technique for making statements as to the degree of linear

association between a criterion (dependent) variable and one or more predicator (independent) variables; a simple linear regression having one independent variable, and multiple linear regression having more than one independent

variable.

Range the difference between the highest and the lowest value in a distribution.

Ratio a fixed relationship between two similar things expressed in terms of the

number of times the first contains the second; the quotient of one quantity divided by another quantity of the same type, generally expressed as a fraction.

Sample as applied to real estate, a set of parcels taken from a given universe which is

used to make inferences about values for the universe.

A probability sample is a sample in which each parcel in the universe is given

equal chance of being included. Also referred to as random sample.

A non-probability sample is a sample in which each parcel in the universe being chosen by other criteria is not given an equal chance of being included.

Essentially all assessment-to-sale ratio studies are non-probability samples.

as applied to real estate, the number of parcels needed from a universe to Sample size

achieve a desired level of precision, given the total number of parcels in the

universe and the standard deviation thereof.

Standard deviation a measure of dispersion, variability, or scatter of values in a given distribution

equal to the square root of the arithmetic mean of the squares of the deviations

from the mean.

Standard error of the mean a measure of the statistical variability of the mean equal to the standard

deviation of the distribution divided by the square root of the sample size.

the selection of sample parcels from distinct groups within the total universe Stratified sampling

based upon the known sizes and characteristics of these distinct groups.

Universe as applied to real estate, all the parcels of a given type in the group under study,

i.e., all the parcels of a given neighborhood, district, etc. Also referred to as

population.
